## DEDICATION

To my wonderful Honey-Bunny (alias lovely wife Judy) and my wonderful Pooski (alias
daughter Jinty) and my granddaughter who gave me the reasons to succeed.

## Disclaimer

My book is so with the understanding that I am not engaging in giving you legal or accounting services, just ideas. Specific investment question should be addressed to a stockbroker, legal questions to a lawyer, and accounting questions to a qualified accountant.

I specifically disclaim any liability, loss, or risk, personal or otherwise, which is incurred as a consequence of any of the contents of this book. Likewise you get to keep all profit you make from the use of this book; I don't get any of them.

## Forward

I would like to thank and complement Mr. Robert Lichello, author of How to Make \$1,000,000 in the Stock Market Automatically who devised the investment system used in my book. I feel it is mandatory to read his book. I'm sure any good bookstore will have a copy or you could order a copy by looking on Amazon or one of the other websites. Mr. L's book planted a seed of inspiration to me like no other investment book I had ever read. I knew it was the way to invest. It so inspired me that I started this book and started investing under the system.

At the time I read the book, the stock market was going great guns in the middle of a big bull market. I had some spare time and started charting stocks I liked under the system to see how well the system worked on real stocks. From those humble beginnings, this book began. It was written under strange conditions about as far away as you can get from the major stock markets - in Seoul, Korea; Maffle, Belgium; and Weilerbach, Germany. The beauty of the system is that it doesn't even require you to be near the market to play. It's so simple and yet so profitable. My hats off to Mr. Lichello and I hope this book helps spread his fine system to an even wider audience.

I wish to make clear that while the system is Mr. Lichello's, the ideas about using it in this book are my own. If you can think of some way to improve on my ideas, I'd be glad to give you credit in a future edition. And now I've come full circle I've gone from having a printed book for the last 20 years that I've been revising constantly to an e-book version. Here is your future edition, I've added information on how to adapt AIM for bear markets, added the latest list of online brokers and many other subtle changes. But the heart of the book remains the same because it is it is a strong heart, capable of handling the job AIM gives it in bull and now bear times.

My original book was printed at Kinko's, now called Kinko's/FedEx using a spiral binding on $8.5 \times 11$ " paper or the traditional letter-size paper. This was done because I have many spreadsheets and other information that needed to be printed in large size so you would be able to read it. Obviously I can't include the spreadsheets in this e-book version because it will appear so small as to be unreadable. So I am not including the spreadsheets in the actual e-book edition.

However anybody who buys my e-book can e-mail me and will receive for free the full size 8.5 x 11 Adobe Acrobat version of my book that will have all of the spreadsheets so that you can go to the particular Chapter and see the spreadsheets that I'm talking about in the e-book. Once you buy this e-book, just e-mail me at jeffee13@hotmail.com and tell me you have bought my e-book; please send me the free Adobe Acrobat version with the spreadsheets and

I will be very happy to send it to you at no charge.

## Introduction

I wrote this book to help all investors - big and small - make money. The simple, easy to learn system will show you an investment method you can use for life. It only takes $15-30$ minutes a month and should average $20 \%-30 \%$ a year over the long haul. It's all explained in Chapter 2.

In addition to showing you the AIM system, I will show you how to choose a stockbroker for buying and selling under the AIM system. To help you pick the best stocks, I offer a monthly HTML newsletter. See my flyer in this book for further details. Anybody who buys a copy of my e-book will receive for free a oneyear subscription to my monthly investing newsletter that shows the best stocks, ETF's, closed-end funds, and LEAPs for the AIM system. Again when you buy a copy of this e-book, just e-mail me at jeffee13@ hotmail.com and I will add your name to my monthly subscriber list for my newsletter.

You will find different strategies ranging from very conservative to highly risky that you can use with the system. You'll find a strategy you'll feel comfortable with. Please read the entire book and I think you'll agree that I offer a simple, easy to learn, quick method to make the most from your hard-earned investment dollars. And it doesn't take very much money to get started as you'll see. If you have any questions, I'll be glad to try and answer them. Please e-mail me. Good luck with your investing.

## Authors Acknowledgments

First of all I'd like to thank Mr. Robert Lichello for the excellent investing system he invented. He has helped lots of people and I hope I am worthy to carry on in his footsteps.

Of course I can't ignore my wonderful wife Judy; again she rates more than just being listed in the dedication. My wonderful wife Judy has been there every step of the way for me and helped me through many dark and difficult times I truly appreciate all the fine things she's done for me, the love she has for me, the love she has for our daughter and granddaughter, and the hard work she does, I want to give her the best possible life.

## Chapter 1 <br> How to Buy and Sell - Picking a Stockbroker

(Note: I originally wrote this book many years ago when Merrill Lynch Blueprint was the only way the small investor could get a break on commissions. I decided to keep the information on Blueprint even though as you'll see later on, there are a lot of online brokers out there with very low commissions. I guess I'm nostalgic.)

There is an easy way for the small investor to play this investing system. The easy way is with the Merrill Lynch Blueprint Program. The Blueprint Program, formerly called the Sharebuilder program, is ideally suited for us, the small investor. Briefly the Blueprint program allows the investor to buy stocks and other investments at low commissions through our branch of Merrill Lynch, their "discount broker."

Merrill Lynch has over 1 million Blueprint customers. The great advantage of Blueprint is that it allows you to buy and sell as little as $\$ 100$ worth of stock (I now recommend selling at higher amounts than $\$ 100$ worth and would be happy to recommend the proper amount you should use with AIM to buy and sell based on how much you are investing in each individual investment as my system recommends, at very low commissions.)

Here's how Merrill Lynch describes Blueprint:
It's a convenient and inexpensive way to build your investment portfolio of stocks, mutual funds, and precious metals. More than 1 million people are building shares in their future and preserving the purchasing power of their dollars by participating in the Blueprint Program. Besides helping increase assets, Blueprint offers these benefits:

Small incremental investments in the securities you select allows you to build your portfolio over time as you invest in stocks, mutual funds, and precious metals. You have an opportunity to buy full and fractional shares because you invest by the dollar, not the share amount. And that is exactly what you are going to do when you learn AIM you're going to buy and sell based on the dollar amount of the buy in the sell and not on a specific number of shares. The Blueprint program will buy you shares
out to four decimal places. For example your account could show 78.9856 shares. This is a tremendous benefit to the small investor. Investment alternatives allow you to diversify your portfolio among thousands of stocks and closed-end funds (later on you'll see I love closed-end funds for AIM investors who want to play AIM and yet get high monthly or quarterly dividends) listed on the New York, American and over-the-counter markets or NASDAQ.

Reduced brokerage fees on securities provide substantial savings off the regular Merrill Lynch commission charges for stocks. When you purchase stocks through the Blueprint program, you can take advantage of transaction fees up to $55 \%$ less than regular Merrill Lynch rates. Below are the Blueprint rates as of April 1988: (compare the "discount commission rates" in 1988 when we didn't have computers and online trading, to what the commissions are today; there is no comparison, commissions have gotten substantially cheaper to the point where AIM is even better system than when Mr. Lichello invented it because back then any commissions were much higher. Now you can safely trade even small amounts at extremely low commission rates.

## Transaction amount - Blueprint Commissions:

See how much cheaper current commissions are!! And no limits on dollar amounts of your trades.
\$0 to \$125-\$12.50
$\$ 125$ to $\$ 200-10 \%$
$\$ 200.01$ to $\$ 500-5 \%$ plus $\$ 10$
$\$ 500.01$ to $\$ 1,000-1.5 \%$ plus $\$ 27.50$
$\$ 1,001.01$ to $\$ 5,000-1.2 \%$ plus $\$ 30.50$
$\$ 5,000.01$ to $\$ 7,500-1.15 \%$ plus $\$ 39.50$
\$7,500.01 and up - Regular rates
(All these rates are very high compared to today's commission rates of less than $\$ 10$ a trade)

Blueprint also charges $\$ 3.85$ as a transaction fee for all trades and now charges $\$ 30$ a year for account maintenance. There are no charges for Ready Asset, (money market) transactions.

The basic reason that Blueprint is better for us small investors is that all brokers including discount brokers have a minimum commission. The regular Merrill Lynch minimum commission (not Blueprint) in August 1984 when I bought 100 shares of our $\$ 4.50$ stock was $\$ 40$. A comparison of several discount brokers from 1984 showed that the minimum commission was around $\$ 30$ or higher. Also some discount brokers only dealt in round lots (100 shares.)

For a small investor, Blueprint is perfect. If you look at the various charts throughout this book, you'll see that our buys and sells our small most of the time. Blueprint is an easy and inexpensive way to make them.

You always have immediate access to your investments under Blueprint. You may change from one investment to another any time. If you wish to buy or sell, Blueprint is only a toll-free (sorry only in the United States), and Blueprint has another advantage... (Merrill Lynch continues on but I stopped.)

## Other discount brokers

Blueprint is a fine inexpensive way to play the system but it's not the only game in town (actually Blueprint doesn't exist anymore!) There are other discount brokers out there. For investors to start with larger sums (for example $\$ 10,000$ per stock) the savings can be substantial. All the charts in this book use Blueprint commissions; if we had paid less than commissions by using another discount broker, our commissions would have been less and our profits more.

Below are the current low commissions for several brokers - one broker - Options Xpress specializes in options trading.

## Brokers on the Web

Note: the rates you see below were written at some point in the past and I'm not sure if they're still the current rates. I'm sure the rates are pretty similar or even lower than what I put down here. You can always go to their website and check out for yourself what the current rates are. I don't want to
be the one to tell you should only go to this broker but I have dealt with TD Ameritrade for years and found them to be an excellent stockbroker that offers many features including free Standard and Poor Reports and other reports that let you do research on various stocks that you're considering buying. They might not be the cheapest one out there but their commission rates are still very low, below $\$ 10$ a trade.

The computer age comes to investing. Now you can do your buying and selling by computer over the Internet. And now you're not even limited to a computer anymore; you can do your buying and selling from your smart phone, iPad or who knows; soon maybe you're just be able to talk to your wrist and make a buy or sell sometime in the future. Technology is amazing and it is helped us investors be able to find a wealth of information very quickly and very easily that I will talk about throughout this book about just how easy it is to find investing information that when I originally wrote this book didn't even exist.

Many stockbrokers and subsidiaries of major brokers offer trading via computer. Most brokers are on the web which means everybody can access them.

I don't have any rating for these brokers. Barron's, a fine financial weekly newspaper, regularly rates stockbrokers and keeps you up-to-date on commission rates. I don't get any commissions from Barron's but I highly recommend that you get a print subscription which also includes a free online subscription. They will talk about many fine stocks and other investments that you could use with AIM or in other investing strategies. You should remember we are looking for low - cost brokers. If you see a low - priced broker, you can bet they offer even more services than full commission brokers used to offer many years ago. You get all the bells and whistles with low-cost brokers that you used to get with full commission brokers. Competition is fierce and companies know that prices are determined in and whether an investor will open an account with a particular broker so they all fight to keep their commissions as low as possible and that benefits you the investor.

Below are online brokers you can check out. I tried to put the necessary information you need to check them out.

Online brokers

Ameritrade - $\$ 9.95$ a trade - $\underline{\mathrm{http} \cdot / / \mathrm{www} . a m e r i t r a d e . c o m ~}$
Cyber Trader - \$9.95 a trade - http://www.cybertrader.com
E-Trade - \$6.99 a trade - http://etrade.com
Fidelity - Gold \$8.00, \$19.95 Bronze - http://www.fidelity.com
InterActive Brokers - up to 100 shares $\$ 1.00$, up to 1,000 shares $\$ 5.00$
http://www.interactivebrokers.com/index.html
Charles Schwab - \$9.95 - \$12.95 a trade - http://www.schwab.com
SieberNet - \$14.95 a trade - http://www.siebernet.com
TD Waterhouse - \$9.99 a trade - http://www.ameritrade.com
Terra Nova - $\$ 5.00$ a trade - http://www.terranova.com
Wall St. Electronics - \$9.99 a trade - $\underline{\text { http } / / / \text { wallstreete.com }}$
Scott Trade - \$7.00 a trade - http://www.scotttrade.com
Options Xpress - $\$ 15.00$ for 10 option contracts; $\$ 14.95$ stock trades
http://wwwoptionsxpress.com

## Chapter 2

## The Mechanics of Buying and Selling

Now for how to buy, sell or do nothing under the (Automatic Investment Management) AIM system. This is an important, probably the most important chapter of the book. You must thoroughly understand and follow this to get the benefits from the AIM system. I'm going to go through it slowly and I want you not only to read and understand practice it with some stocks of your own until it becomes second nature. And it will! At first it might seem complicated, but it's really incredibly simple. And once you learn it you will be doing exactly the same thing every month but the results will be different. Some months the system will tell you to buy and it will tell you how much to buy or how many dollars' worth of the investment to buy or how many dollars' worth of the investment to sell or AIM may want you to do nothing because the price of the investment hasn't gone down or up enough for AIM to decide to make a buy or sell. Here's how to do it.

You will see below that I wrote this chapter a while ago. There still may be some old-fashioned investors don't like computers so this will appeal to them. For the rest of you I have created a Word version of the spreadsheet and you can easily do all of these calculations on an Excel or Word spreadsheet. And you can make it easier by putting in a few very simple formulas in some of the columns and will make your work even easier. Again when you buy my e-book, you will receive all of this information in the Adobe Acrobat version of my book for free and I will provide you with a free version of the spreadsheet for both stocks and LEAPs because the LEAP spreadsheet is a little bit different and you will get up many other fine free bonuses so it's a heck of a deal.

First you'll need to buy or get some 13 - column paper (this is the type of accounting spreadsheets on paper I first used when I went to work as an auditor with the U.S. Army in 1983 which was BC or before computers. Paper is very common accountant/auditor paper designed to write numbers on. Any business supply store will have or at least would have it many years ago; it's probably harder now to find. Again like I said you can easily do all of this on an Excel spreadsheet and I'm
sure most of you will prefer to do it on an Excel spreadsheet then to do it with a pencil and piece of paper but for those old-fashioned people I will keep the explanation the same as I wrote it many years ago before computers came around.

Ask your business friends. National makes the paper I use, \#45-813. It comes in pads. If you have a computer than any spreadsheet software could be used to set up the system you can find two excellent software programs that do AIM on my website - http $J / / \mathrm{www} . j \mathrm{jijinvesting.com}$

Now a quick explanation of what every column means before we go through two years of one stock and you see the system in action.

Remember like I will say frequently throughout this book, you will obtain all the spreadsheets from the Adobe Acrobat printed version of my book for free after you buy this e-book.

Column 1 DATE - the date becomes the month and year (for example 6/11.) You check your stock at least once a month or more often as you will see when I talk in my book, maybe even daily for some of the more volatile investments like LEAPs or leveraged ETF's. You will see in this example in Chapter 2, I am just going to be checking the stock monthly. And you will see just checking it monthly can still make you quite a nice profit. So $6 / 11$ would be followed by $7 / 11$, followed by 8/11-I think you get the picture.

Column 2 REMARKS - here you will list things such as readjust stock/cash ratio, stock splits using different SAFE percent's ( $10 \%$ is the normal SAFE amount as you'll see later on) but we will use different SAFE percent's in bear markets.

Column 3 - SHARE PRICE - this is the closing price of one share as reported in the newspaper or the website for the day you're checking. You can easily find daily prices at http://yahoo.com in the financial section or if you have an iPhone, all you have to do is click on the stocks application on the front of your phone and there you find the latest prices on any investments that you're interested in.

Column 4 -SHARE VALUE - this is the SHARE PRICE from column 3 multiplied by the number of SHARES OWNED which is found in column 8.

Column 5 SAFE - SAFE is an arbitrary $10 \%$ of the share value found in column 2. Thus if your SHARE VALUE is $\$ 5,000$, your SAFE amount would be $\$ 500$. You'll see how SAFE helps you from buying and selling too soon when we go through the actual example stock.

Column 6 - CASH - originally Robert Lichello said to use a ratio of 50\% CASH and 50\% shares when you start an AIM investment. So for example, if you started with $\$ 10,000$, you would have $\$ 5,000$ in stock, and $\$ 5,000$ in CASH. I have found that we can vary the amount of cash in an AIM investment depending on the volatility of the investment. A quick example is on a LEAP which is a very volatile investment; you would always want to use a ratio of $50 \%$ CASH and $50 \%$ LEAPs. And on a closed-end fund that you buy for income, you can safely use a ratio of one third CASH and two thirds closed-end fund shares that would mean on a $\$ 10,000$ investment, you could own $\$ 6,677$ worth of closed-end fund shares and $\$ 3,333$ for CASH. One disadvantage nowadays of keeping a great amount of cash in your broker's money market account, is that money market accounts pay a very low interest rate usually less than $1 \%$ which means you're not earning very much on the money but having cash to buy shares at cheaper prices is an essential that will pay off for you later on when your stock or other investment goes down and you need to buy more shares. Your CASH total will go up or down every month depending on whether you're buying and selling and earning interest on your cash. Also I view it as optional if you want to deduct the cost of the commissions as you make buys and sells. Personally I wouldn't bother worrying about the commissions you make enough profits without really worrying about it.

You'll see that the AIM system is very conservative as most of your investment will go to CASH. If you have a buy, then Column 6 (CASH) -, Column 11 (MARKET ORDER BUY) X 1.005 (interest) equals next month's cash total. If you have a sell, then, Column $6+$ Column 11 (MARKER ORDER (SELL) x 1.005 equals next month's cash total.

Column 7 - SHARES BOUGHT (SOLD) - After you make your monthly check of the stock or other investment price, you might be buying some shares, selling some shares or doing nothing. In this column you will record the number of shares you bought or sold for that particular day in time. If you did nothing, put - (dash) in the column. To arrive at the number of shares you bought or sold, you divide the dollar amount in column 11 (MARKET ORDER BOUGHT (SOLD) by the SHARE PRICE in column 3. For example, if the system tells you to sell $\$ 200$ worth of stock and the stock
is selling for $\$ 10$ a share, then you sell 20 shares. Remember to put the ( ) around the sold stock to keep separate buy and sell transactions which are sharing the same column.

Column 8 - SHARES OWNED - This is the number of shares you currently own. This figure will constantly go up and down. If your stock splits, you would double the number of shares you own. Column 8 equals last month's column 8 plus any shares you bought in the previous month or column 8 equals last month's column 8 minus any shares sold in the previous month or day that you did AIM. If the previous month or day that you did AIM and AIM told you don't need to make any buys or sells then column 8 would be the same number of shares in the row just above the current row you're using.

Column 9 PORTFOLIO CONTROL - Another important column. When you start, put a dollar amount equal to the amount of stock you bought (this is only a control number, no money involved with this column.) If you start with $\$ 1,000$ worth of stock, your PORTFOLIO CONTROL amount/number is also 1,000 . After your initial injection of money, PORTFOLIO CONTROL will only change if you buy more stock. Every time you buy more stock, you add half the amount you bought to your PORTFOLIO CONTROL total. For example, the system tells you to buy $\$ 400$ worth of stock; you add $\$ 200$ to your prior PORTFOLIO CONTROL total. If no buy, then column 9 is the same as the prior month.

Column 10 - BUY (SELL) ADVICE - Every month you look at your SHARE VALUE (column 4) and PORTFOLIO CONTROL.) If your SHARE VALUE is higher, you put that figure on top; if you're PORTFOLIO CONTROL amount is higher, you put that on top. For example: if your SHARE VALUE is $\$ 5,000$ and your PORTFOLIO CONTROL amount is higher, you put PORTFOLIO CONTROL on top. For example: if you're SHARE VALUE IS \$5,000 and your PORTFOLIO CONTROL is $\$ 3,000$ then you would put the higher value on top like this:

| SHARE VALUE | $\$ 5,000$ |
| :--- | :--- |
| - PORTFOLIO CONTROL | 3,000 |
| $=$ (SELL) ADVICE | $\$ 2,000$ |

Or if PORTFOLIO CONTROL is higher:

| PORTFOLIO CONTROL | 5,000 |
| :--- | :--- |
| - SHARE VALUE | $\underline{\$ 3,000}$ |
| = BUY ADVICE | $\$ 2,000$ |

Column 11 - MARKET ORDER BUY (SELL) - this is the column that tells you whether you make an order or not. You take the amount from column 10, BUY (SELL) ADVICE, and subtract out the SAFE (column 5) amount. If the amount is over $\$ 300$ (this is my new rule of thumb for determining when you make actual buys or sells.) This means you go online and tell your broker that you want to buy or sell the dollar amount of your MARKET ORDER. If you have a sell order, you have to figure out how many shares you must sell (column 11 divided by column 3, SHARE PRICE) and tell your broker to sell that many shares. For example, if your market order was to sell $\$ 300$ worth of $\$ 8.10$ stock, then you would tell your broker to sell 37 shares. You would do the same exact thing if it's a buy order, you divide the dollar amount of the buy order by the current price of the stock and that determines how many shares you buy. Always remember investing is an art and not a science, so if the AIM system tells you to buy 37 shares, then you can easily round that off to buy 40 shares and everything will work fine.

COLUMN 12-6\% INTEREST - this is the amount of interest earned by your cash total from column 6. The .005 is $1 / 12$ of $6 \%$ or the amount of interest you earn in one month. I picked $6 \%$ because it's easy to work with an overlong period of time and is a fair average of the interest rate for money market funds over the long-term and it keeps things simple - monthly interest is always one half of $1 \%$. I know right now that interest amount seems very high compared to what money market funds are paying but remember we are in this for the long haul and if you play AIM over the next 20-30 years it will average out to $6 \%$ interest as a fair number of use.

Column 13 - PORTFOLIO VALUE/TOTAL - Add the value of your CASH, column 6 + column 4, the value of your stock or other investment and you have the total current value of your investment. You
will notice one nice thing about the AIM spreadsheet. Once you start with the stock you see exactly what you're starting amount is in the very first row when you look at PORTFOLIO TOTAL. In this example we are starting with a PORTFOLIO TOTAL of $\$ 10,000$.

So when you compare PORTFOLIO TOTALs in the future rows, you can easily see exactly what your status is, if the PORTFOLIO TOTAL is higher than $\$ 10,000$ then you are ahead or profitable. If the PORTFOLIO TOTAL is less than $\$ 10,000$, you currently have a "paper loss". All that means is that the stock or other investment is cheaper than when you originally bought it, and possibly AIM is telling you to buy more shares of this cheap stock so when it turns around and goes higher later on you will own more shares that will go up in value and that will increase your profits.

Now I will go through an actual stock and show you just how easy it is. Get your pencil, calculator, and 13 - column paper or your Excel spreadsheet. Write all the headings in the proper columns. Remember you will get a copy of my book in the Adobe Acrobat version that will have the spreadsheet illustrated to make it easier for you to understand. Now write the name of the stock, for this example I picked Claire's Stores, see the chart at the end of this Chapter in the Adobe Acrobat version of the book. Then below the name list the stock exchange, NYSE equals the New York Stock Exchange. The first month in our example is June 1994 (6/94), write that in your date column. Then we are going to imagine that we have $\$ 10,000$ to invest. Having a calculator will make your figuring easier. Now let's start with June 1994.

The first month is Jun. 94 (6/94), write that in your date column. Then we are going to imagine that we have $\$ 10,000$ to invest. Having a calculator will make your figuring easier.

JUNE 1994

| Date <br> Col. <br> 1 | Remarks <br> Col. 2 | Share <br> Price <br> Col. 3 | Share <br> Value <br> Col. 4 | $\begin{aligned} & \hline \text { SAFE } \\ & \text { Col. } 5 \end{aligned}$ | Cas <br> h <br> Col. <br> 6 | Shares <br> Bought <br> (Sold) <br> Col. 7 | Shares Owned Col. 8 | $\begin{gathered} \text { Port } \\ \text { Control } \\ \text { Col. } 9 \end{gathered}$ | Buy (Sell) Advice Col. 10 | Mrk <br> Order <br> (Sell) <br> Buy <br> Col. 11 | $\begin{gathered} \hline \mathbf{6 \%} \\ \text { Int } \\ \text { Col } \\ 12 \end{gathered}$ | Comm | Port <br> Value <br> Col 13 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 6/94 |  | 10.25 | 6700 | 670 | $\begin{gathered} 330 \\ 0 \end{gathered}$ | - | 654 | 6700 | - | - | - | - | 10,000 |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |

We start with $\$ 10,000$ to invest. First we look at the price of the stock in the newspaper or on the website. A great website to look up stock prices is Yahoo Finance on you have to do is type in the symbol and you'll see exactly what the current price of any stock or other investment is. When you actually buy your stock or other investment, you'll have to wait to get your statement to see what the actual price was. Stock prices move quickly so you may have put in an online order to say buy Claire's Stores and Yahoo told you the price was $\$ 10.25$. You might find when you actually buy it maybe you bought the stock at $\$ 10.20$ or $\$ 10.30$ so that is the price you would want to put down when you find that your actual buy price. Our stock was selling for $\$ 10.25$. Write that in column 3. Our first share value will be $2 / 3$ of our $\$ 10,000$ or $\$ 6,700$ rounded off. Write $\$ 6,700$ in column 4 . In this example you see I used the liberal idea of two thirds stock and one third cash. Based on the investment you are in; I may recommend that you go $50 \%$ cash and $50 \%$ stock. It all depends on the volatility of the investment.

Then in column 5, $\$ 670$ because SAFE is always $10 \%$ of the SHARE VALUE in column 4 . Then right $\$ 3,300$ in column 6 because you always start with two thirds of your money in stock and one third in cash on a conservative investment. In column 8 you write the number of shares you own. This is figured by dividing SHARE VALUE in column 4 by the SHARE PRICE - in column 3-\$10.25 equals 654
shares. Always round off, if you get 653.9 , then 654 shares, if 653.3 , then 653 shares. Then in column 9 PORTFOLIO CONTROL, put in the same number as you had in column 4, SHARE VALUE, 6,700.

Column 10 doesn't come into play yet, and column 11 doesn't either. You haven't earned any interest yet, so column 12 is blank also. Now add up the value of the stock you bought in column 4 and the amount of cash in column 6 and you have your total for PORTFOLIO VALUE. Put \$6,700 + \$3,300 equals $\$ 10,000$. Now let me show you how simple and profitable the system will be for you. Remember to reinvest all dividends into your money market account. Just tell your broker when you open your account that you always want any dividends placed into your money market account and you do not want to buy additional shares or fractions of shares with any dividends you receive.

## JULY 1994

| $\begin{gathered} \text { Date } \\ \text { Col. } 1 \end{gathered}$ | Remarks Col. 2 | Share <br> Price <br> Col. 3 | Share <br> Value <br> Col. 4 | $\begin{aligned} & \hline \text { SAFE } \\ & \text { Col. } 5 \end{aligned}$ | $\begin{aligned} & \text { Cash } \\ & \text { Col. } 6 \end{aligned}$ | Shares <br> Bought <br> (Sold) <br> Col. 7 | Shares Owned Col. 8 | Port <br> Control <br> Col. 9 | Buy (Sell) Advice Col. 10 | Mrk <br> Order <br> (Sell) <br> Buy <br> Col. <br> 11 | $\begin{gathered} \mathbf{6 \%} \\ \text { Int } \\ \text { Col } \\ 12 \end{gathered}$ | Comm | Port <br> Value <br> Col 13 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 6/94 |  | 10.25 | 6700 | 670 | 3300 | - | 654 | 6700 | - | - | - | - | 10,000 |
| 7/94 |  | 10.00 | 6540 | 654 | 3317 | - | 654 | 6700 | 160 | - | 17 | - | 9,857 |

Now how to use the system in the real world. On July 1 or thereabouts, you pick up your newspaper or look on your website. You look under the New York Stock Exchange and find Claire's Stores. From now on I'm just going to say you look on your website because when I wrote this, newspapers were a lot greater source of stock market information than they are today. Today everything you want is either on a website or your iPhone on your iPad etc. so now on we would just say we look it up on the web. My new iPhone has this great little feature; all I have to do is press the stock market app on the very opening screen and I can find out all the information on stock prices you ever dreamed of. Once you type the symbol in, you can always find any symbol by going to Yahoo Finance. At http://www.barrons.com and going down to the bottom and opening up either the New York or NASDAQ stock exchange going to the first letter of the stocks name scrolling down and you will see the symbol right next to the name of the stock.

We find Claire's Stores and see that the price on July 1 is $\$ 10$ which we write in column 3. Did you remember to put July, 94, - 7/94, in the date column? Now go to column 8 for July 94. Look above in column 8 and you will see you owned 654 shares in June and you didn't buy or sell any in column 7 . This is why you leave column 7 blank in the first month. You still own 654 shares. Write 654 in column 8 for July 94. Also your PORTFOLIO CONTROL amount is still the same (you didn't buy anything in addition to the opening buy in the first month, when you opened your account) so write 6,700 in column 9. Now multiply the number of shares owned (654) by the share price ( $\$ 10$ ) and you have your SHARE VALUE for column 4. Now CASH, you'll notice, has grown from $\$ 3,300$ to $\$ 3,317$. This is
because you earned $\$ 17$ interest which you write in column 12. If you had bought or sold stocks the preceding month, this would have also affected cash this month.

Now you take your two key amounts - SHARE VALUE and PORTFOLIO CONTROL and look at them. Which is higher? PORTFOLIO CONTROL is higher $(6,700)$ than SHARE VALUE $(6,540)$. Since PORTFOLIO CONTROL is higher, put PORTFOLIO CONTROL on top. You'll be seeing this chart every month. Once you start doing this, you won't need the chart, but it's a good way to learn.

| PORTFOLIO CONTROL | 6,700 |
| :--- | :--- |
| - SHARE VALUE | $\underline{\$ 6,540}$ |
| = BUY ADVICE | $\$ 160$ |

You now have a potential buy for $\$ 160$ but it's only potential. Now look at the SAFE amount in column 5 and you find that it is 654 which is higher than your buyer advice in column 10. So you put zero in column 11, MARKET ORDER BUY because your signal isn't strong enough to give you a market order yet. Put a - in column 7 since you won't be buying or selling any stock this month. Be patient the system doesn't want you to sell or buy too soon. You'll get plenty of chances. Now all you have to do is figure column 13, PORTFOLIO VALUE. You remember, add column 4, SHARE VALUE and column 6, CASH and you have the current value of your investment. This month it's $\$ 6,540+\$ 3,317=$ $\$ 9,857$. If the stock goes up in price, you'll have a potential sell and if it goes down, a potential buy.

## AUGUST 1986

| Date <br> Col. <br> 1 | Remarks Col. 2 | Share <br> Price <br> Col. 3 | Share <br> Value <br> Col. 4 | $\begin{aligned} & \hline \text { SAFE } \\ & \text { Col. } 5 \end{aligned}$ | Cash <br> Col. 6 | Shares <br> Bought <br> (Sold) <br> Col. 7 | Shares <br> Owned <br> Col. 8 | Port Control Col. 9 | Buy <br> (Sell) <br> Advice <br> Col. 10 | Mrk Order (Sell) Buy Col. 11 | $\begin{array}{r} \hline 6 \% \\ \text { Int } \\ \text { Col } \\ 12 \end{array}$ | Comm | Port <br> Value <br> Col 13 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 7/94 |  | 10.00 | 6540 | 654 | 3317 | - | 654 | 6700 | 160 | - | 17 | - | 9,857 |
| 8/94 |  | 12.37 | 8093 | 809 | 3334 | (47) | 654 | 6700 | (1393) | (584) | 17 | - | 11,427 |

Now for August 94. I'll be shorter in my explanations and you'll see you will still understand because you did the same thing every month. While every month is done the same, the outcome can be quite different.

First look up the price of Claire's stock. Claire's price is $\$ 12.37$. Write in column 3. Then multiply the number of shares owned (still 654 shares since you didn't buy or sell any last month) by the price of one share and that gives you a SHARE VALUE of $\$ 8,093$. SAFE is always $10 \%$ so write 809 in column 5. Again the only thing that affected CASH is INTEREST; you earned another \$17. So write $\$ 17$ in column 12 and add $\$ 17$ to your CASH. You now have $\$ 3,334$ in CASH. Since you didn't buy any stock last month, PORTFOLIO CONTROL stays the same at 6,700. Again the magic two numbers, SHARE VALUE and PORTFOLIO CONTROL. Again since SHARE VALUE is higher put that on top. Since SHARE VALUE is higher, you have a potential (sell) signal; now write the higher amount SHARE VALUE on top:

| SHARE VALUE | $\$ 8,093$ (COL. 4) |
| :--- | :--- |
| - PORTFOLIO CONTROL | $\underline{6,700}$ (COL. 9) |
| = (SELL) ADVICE | $\$ 1,393$ (COL. 10) |
| Now subtract SAFE from (SELL) ADVICE | $\underline{-809}$ (COL.5) |

|  |  |
| :--- | :--- |
| $=$ MARKET ORDER (SELL) | $\$ 504$ (COL.11) |

You should be writing all these figures on your sample spreadsheet the same as the illustration at the end of the Chapter shows. Again you will find all of these Excel spreadsheets with all of the information when you look at the printed version of my book in Adobe Acrobat that I will send you for free. At the end of this Chapter in the Adobe Acrobat book is a blank sheet you can photocopy and use.

As you can see, you're getting your first sell order. Now divide $\$ 584$ by the SHARE PRICE (\$12.37) and you have 47 shares to sell. Write (47) in SHARES BOUGHT (SOLD) column. Now finish your months' work by figuring out your PORTFOLIO VALUE. It's $(\$ 8,093)+$ column $6(\$ 3,334)=$ \$11,427.

You're ahead $\$ 1,427$ but better things are still ahead.

SEPTEMBER 1994

| Date Col. 1 | Remarks <br> Col. 2 | Share <br> Price <br> Col. 3 | Share Value Col. 4 | SAFE <br> Col. 5 | Cash <br> Col. 6 | Shares <br> Bought <br> (Sold) <br> Col. 7 |  |  | Buy <br> (Sell) <br> Advice <br> Col. 10 | $\begin{gathered} \text { Mrk } \\ \text { Order } \\ (\text { Sell }) \\ \text { Buy } \\ \text { Col. } 11 \end{gathered}$ | $\begin{gathered} \hline 6 \% \\ \text { Int } \\ \text { Col } \\ 12 \end{gathered}$ | Comm | Port <br> Value <br> Col 13 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 8/94 |  | 12.37 | 8093 | 809 | 3334 | (47) | 654 | 6700 | (1393) | (584) | 17 | - | 11,427 |
| 9/94 |  | 12.50 | 7588 | 758 | 3938 | (10) | 607 | 6700 | (888) | (130) | 20 | - | 11,526 |

Now even quicker because I'm sure you understand how simple and repetitive the system is and soon you'll see its power. Try doing September 94 on your own. Remember to start by looking up the price of Claire's Stores. Since this is an example, of course you can't but soon you'll be doing your own stocks and this will be the first step.

Okay, the price has risen and is now $\$ 12.50$. Write down $\$ 12.50$ and then fill in column 9 that didn't change since no buying last month. But column 8, SHARES OWNED, did change. We sold 47 shares last month. So subtract 47 from the column 8 total from the prior month ( $654-47=607$ ). Write 607 in column 8, SHARES OWNED. Now figure column 6 CASH. You started with $\$ 3,334$ and must add the $\$ 584$ you got from selling the stock. So $\$ 3,334+\$ 584=\$ 3,918+\$ 20$ for INTEREST $=\$ 3,938$, WRITE in column 6, CASH. Write $\$ 20$ in column 12, INTEREST.

Then compare column 4 with column 9 and see which is higher. SHARE VALUE is still higher $\$ 7,588$ To PORTFOLIO CONTROL's 6,700. You can figure you have a potential (SELL) of $\$ 888$ that you write in column 10 in ( ). You glance at SAFE and see its lower than your potential (SELL) ADVICE $(888-758=130)$, so you write (130) in column 11, MARKET ORDER (SELL) BUY. You have a sell. Now divide $\$ 130$ by $\$ 12.50$ and you find you sold 10 shares. In this example I am making any sells over $\$ 100$. Many years later I have decided that is too low because it generates too many commissions and so I've basically raised the amount of any buy or sell to a minimum of $\$ 300$ so you would pay fewer commissions and sell at higher prices and buy at lower prices. Write (10) in column 7, SHARES BOUGHT (SOLD). Add up the value of your portfolio in column 13 - remember it's CASH + SHARE VALUE. Your PORTFOLIO VALUE is $\$ 11,526$.

OCTOBER 1994

| Date <br> Col. 1 | Remarks Col. 2 | Share <br> Price <br> Col. 3 | Share <br> Value <br> Col. 4 | SAFE <br> Col. 5 | $\begin{aligned} & \text { Cash } \\ & \text { Col. } 6 \end{aligned}$ | Shares <br> Bought <br> (Sold) <br> Col. 7 |  |  | Buy <br> (Sell) <br> Advice <br> Col. 10 | $\begin{gathered} \hline \text { Mrk } \\ \text { Order } \\ (\text { Sell }) \\ \text { Buy } \\ \text { Col. } 11 \end{gathered}$ | $\begin{array}{r} \hline 6 \% \\ \text { Int } \\ \text { Col } \\ 12 \end{array}$ | Comm | Port Value <br> Col 13 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 9/94 |  | 12.50 | 7588 | 758 | 3938 | (10) | 607 | 6700 | (888) | (130) | 20 | - | 11,526 |
| 10/94 |  | 11.00 | 6567 | 656 | 4088 | - | 597 | 6700 | 133 | - | 20 | - | 10,655 |

Now October 94. Stock price is $\$ 11.00$ (stock prices to go down). Again write the SHARES OWNED and PORTFOLIO CONTROL numbers in columns 8 and 9. Column 9, PORTFOLIO CONTROL hasn't changed since no buying but SHARES OWNED did change since we sold 10 shares. So go to last month's column 8 total and subtract $10(607-10=597)$ and write that number in column 8. Now figure SHARE VALUE and you see it's less than $\$ 6,700$. It's $\$ 6,567$ to be exact. SAFE is always $10 \%$ of SHARE VALUE so fill that in. CASH again was affected by selling. You started with $\$ 3,938$ and added $\$ 130+\$ 20$ INTEREST $=\$ 4,088$.

Now look at PORTFOLIO CONTROL and it is higher than SHARE VALUE so put PORTFOLIO CONTROL on top, think P for purchase. You have BUY ADVICE of \$133. Before you do anything, you still must compare BUY ADVICE to SAFE. SAFE is still going to cancel any market order. Did you remember not to put ( ) around zero in column 11? I don't bother putting ( ) around 0 in column 11 , I just use a - Again if you haven't given yourself $\$ 20$ in INTEREST, add $\$ 20$ to your CASH account and again add SHARE VALUE and CASH to obtain your PORTFOLIO VALUE. Your PORTFOLIO VALUE is $\$ 10,655$.

Again all of this is going to see much easier when you're reading it while looking at the Adobe Acrobat version of my book which will show all of the Excel spreadsheet rows and columns that will make it much easier to follow what I am talking about.

NOVEMBER 1994

| Date Col. 1 | Remarks Col. 2 | Share <br> Price <br> Col. 3 | Share <br> Value <br> Col. 4 | $\begin{aligned} & \text { SAFE } \\ & \text { Col. } 5 \end{aligned}$ | Cash <br> Col. 6 | Shares <br> Bought <br> (Sold) <br> Col. 7 | Shares <br> Owned <br> Col. 8 | Port <br> Control <br> Col. 9 | Buy <br> (Sell) <br> Advice <br> Col. 10 | Mrk <br> Order <br> (Sell) <br> Buy <br> Col. 11 | $\begin{gathered} \hline \mathbf{6 \%} \\ \text { Int } \\ \text { Col } \\ \mathbf{1 2} \end{gathered}$ | Comm | Port <br> Value <br> Col 13 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 10/94 |  | 11.00 | 6567 | 656 | 4088 | - | 597 | 6700 | 133 | - | 20 | - | 10,655 |
| 11/94 |  | 11.37 | 6791 | 679 | 4108 | - | 597 | 6700 | (91) | - | 20 | - | 10,899 |

Now November 94 and the stock has risen a little. Remember the beauty of the system: buy low and sell high. Watch it work. Okay, SHARE PRICE has risen to $\$ 11.37$. Write it in SHARE PRICE and number of SHARES OWNED and PORTFOLIO CONTROL, which didn't change since no buying last month. Now multiply number of shares 597 X SHARE PRICE $\$ 11.37$ and your SHARE VALUE is $\$ 6,791$. Again SAFE is $10 \%$ of SHARE VALUE or 679. CASH has earned another $\$ 20$ of INTEREST, write that in column 12 and add the $\$ 20$ to CASH total in col. 6. Look at SHARE VALUE and PORTFOLIO CONTROL and as you thought, SHARE VALUE is higher which could possibly signal a sell. Write SHARE VALUE on top and PORTFOLIO CONTROL below:

| SHARE VALUE | $\$ 6,791$ |
| :--- | :---: |
| - PORTFOLIO VALUE | $\underline{6,700}$ |
| = SELL ADVICE | $\$ 91$ |

Now compare your (SELL) ADVICE to SAFE and you see that SAFE overrules any selling this month.

Again is $\$ 0$ but we use a - instead of writing $\$ 0$. Again finish off the month by figuring your PORTFOLIO VALUE: SHARE VALUE + CASH or $\$ 6,791+\$ 4,108=\$ 10,899$ or your investment is up $\$ 899$. Keep thinking long-haul.

DECEMBER 1994

| $\begin{gathered} \text { Date } \\ \text { Col. } 1 \end{gathered}$ | Remarks Col. 2 | Share <br> Price <br> Col. 3 | Share <br> Value <br> Col. 4 | $\begin{aligned} & \text { SAFE } \\ & \text { Col. } 5 \end{aligned}$ | Cash <br> Col. 6 | Shares <br> Bought <br> (Sold) <br> Col. 7 | Shares <br> Owned <br> Col. 8 | Port <br> Control <br> Col. 9 | Buy <br> (Sell) <br> Advice <br> Col. 10 | Mrk <br> Order <br> (Sell) <br> Buy <br> Col. 11 | $\begin{gathered} \hline 6 \% \\ \text { Int } \\ \text { Col } \\ 12 \end{gathered}$ | Comm | Port <br> Value <br> Col 13 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 11/94 |  | 11.37 | 6791 | 679 | 4108 | - | 597 | 6700 | (91) | - | 20 | - | 10,899 |
| 12/94 |  | 11.75 | 7015 | 701 | 4128 | - | 597 | 6700 | (315) | 0 | 20 | - | 11,143 |

Now December 94. Again look up the SHARE PRICE (its $\$ 11.75$ ). Write it in column 3. Now go to column 8, SHARES OWNED and column 9, PORTFOLIO CONTROL; since you did nothing last month both stayed the same. Now business as usual.

Multiply the number of shares (597 X SHARE PRICE \$11.75) and your SHARE VALUE is $\$ 7,015$ write it in column 4 . CASH was only affected by INTEREST so add $\$ 20$ to this month's total and write $\$ 20$ in column 12, INTEREST. Now compare PORTFOLIO CONTROL to SHARE VALUE. SHARE VALUE is $\$ 7,015$ and bigger than PORTFOLIO CONTROL so you place it on top. Again remember P for purchase if PORTFOLIO CONTROL is on top and S for sell if SHARE VALUE is on top. Very simple. So do your calculations:

| SHARE VALUE | $\$ 7,015$ |
| :--- | :--- |
| - PORTFOLIO CONTROL | $\underline{6,700}$ |
| = (SELL ) ADVICE | $\$ 315$ |
| - SAFE | $\underline{701}$ |
| = MARKET (SELL) ORDER | $\$ 0$ |

You do nothing. Then you figure PORTFOLIO VALUE. Remember how? See this is easy. You added SHARE VALUE of $\$ 7,015+$ CASH of $\$ 4,128=\$ 11,143$. You're ahead $\$ 1,143$.

## JANUARY 1995

| Date Col. 1 | Remarks Col. 2 | Share <br> Price <br> Col. 3 | Share <br> Value <br> Col. 4 | $\begin{aligned} & \hline \text { SAFE } \\ & \text { Col. } 5 \end{aligned}$ | $\begin{aligned} & \text { Cash } \\ & \text { Col. } 6 \end{aligned}$ | Shares <br> Bought <br> (Sold) <br> Col. 7 | Shares <br> Owned <br> Col. 8 | Port Control Col. 9 | Buy <br> (Sell) <br> Advice <br> Col. 10 | Mrk <br> Order <br> (Sell) <br> Buy <br> Col. 11 | $\begin{gathered} \hline 6 \% \\ \text { Int } \\ \text { Col } \\ 12 \end{gathered}$ | Comm | Port <br> Value <br> Col 13 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 12/94 |  | 11.75 | 7015 | 701 | 4128 | - | 597 | 6700 | (315) | 0 | 20 | - | 11,143 |
| 1/95 |  | 11.62 | 6940 | 694 | 4148 | - | 597 | 6700 | (240) | 0 | 20 | - | 11,088 |

Now January 95. Again start with SHARE PRICE. It's $\$ 11.62$. Now go to column 8, SHARES OWNED. Again you did no buying or selling so they stay the same.

Now back to column 4, SHARE VALUE is always the number of shares X SHARE PRICE. Multiply column 8,597 shares X SHARE PRICE. Your SHARE VALUE is $\$ 6,940$. Again SAFE is $10 \%$ so write 694 in column 5. Now CASH, again only INTEREST affected cash so add $\$ 20$ to the CASH total and put $\$ 20$ in column 12. Write it in. Again compare PORTFOLIO CONTROL and SHARE VALUE:

| SHARE VALUE | $\$ 6,867$ |
| :--- | :--- |
| - PORTFOLIO CONTROL | 6,700 |
| = (SELL) ADVICE | $\$ 240$ |
| - SAFE | $\$ 694$ |
| = MARKET (SELL) ORDER | $\$ 0$ |

You can safely ignore buy and sell orders under \$300. Again figure out your PORTFOLIO VALUE it's $\$ 11,088$. Easy isn't it. Keep checking your spreadsheet against mine and make sure the numbers agree. Remember to round off your number; you don't need to worry about cents (except for column 3, SHARE PRICE).

FEBRUARY 1995

| Date | Remarks | Share <br> Col. <br> Col. 2 <br> Price <br> Col. 3 | Share <br> Value <br> Col. 4 | SAFE <br> Col. 5 | Cash <br> Col. 6 | Shares <br> Bought <br> (Sold) | Shares <br> Owned <br> Col. 8 | Port <br> Control <br> Col. 9 | Buy <br> (Sell) <br> Advice <br> Col. 10 | Mrk <br> Order <br> (Sell) <br> Buy <br> Col. 11 | $\mathbf{6 \%}$ <br> Int <br> Col <br> $\mathbf{1 2}$ | Comm | Port <br> Value <br> Col 13 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $1 / 95$ |  | 11.62 | 6940 | 694 | 4148 | - | 597 | 6700 | $(240)$ | 0 | 20 | - | 11,088 |
| $2 / 95$ |  | 14.12 | 8433 | 843 | 4168 | $(63)$ | 597 | 6700 | $(1733)$ | $(890)$ | 20 | - | 12,601 |

Now February 95. SHARE PRICE has risen and is now $\$ 14.12$, write that in column 3. Now go back to columns 8 and 9 . Since you didn't buy or sell any stock last month, these amounts don't change. So write in 597 for number of SHARES OWNED and 6,700 and for PORTFOLIO CONTROL. Then figure out your SHARE VALUE (it's $597 \mathrm{X} \$ 14.12=\$ 8,433$ ). Write it in column 4. Again SAFE is $10 \%$ of column 4, so write in 843 in column 5. CASH is simple since you did no buying or selling; just add the INTEREST earned $\$ 20$ to last month's total and write in your new total of $\$ 4,168$. Again compare PORTFOLIO CONTROL to SHARE VALUE. By now your brain should be telling you that since the SHARE PRICE rose, you probably have a sell. Again as you always do, put the largest amount on top:

| SHARE VALUE | $\$ 8,433$ |
| :--- | :---: |
| - PORTFOLIO CONTROL | $\underline{6,700}$ |
| = (SELL) ADVICE | $\$ 1,733$ |
| - SAFE | $\underline{843}$ |
| = MARKET (SELL) ORDER | $\$ 890$ |

Remember to write all the above amounts in their proper columns. Every column either has a number or a -; never will a column be blank. Meanwhile back at the spreadsheet.

Now you have a MARKET ORDER (SELL) for $\$ 890$. All you have to do is divide $\$ 890$ by the SHARE PRICE $\$ 14.12$ and you find out you SOLD 63 shares. Put (63) shares in column 7 for February 95. Again finish off your month by figuring your PORTFOLIO VALUE. It's SHARE VALUE of $\$ 8,433+$ CASH of $\$ 4,168=\$ 12,601$.

Now try to imagine this for real. It's one thing to play quite another when it's for keeps, when it's your money. You got to work at being mentally tough when it comes to the hard, lean times of investing. For every peak you'll also find some valleys; always think for the long term. Study the history of the stock (Claire's Stores) and you see those peaks and valleys. Look where you stand at the end and you'll have a grand view of those valleys from your peak.

## MARCH 1995

| Date <br> Col. <br> 1 | Remarks Col. 2 | Share <br> Price <br> Col. 3 | Share <br> Value <br> Col. 4 | $\begin{aligned} & \text { SAFE } \\ & \text { Col. } 5 \end{aligned}$ | $\begin{aligned} & \text { Cash } \\ & \text { Col. } 6 \end{aligned}$ | Shares <br> Bought <br> (Sold) <br> Col. 7 | Shares <br> Owned <br> Col. 8 | Port Control Col. 9 | Buy <br> (Sell) <br> Advice <br> Col. 10 | Mrk <br> Order <br> (Sell) <br> Buy <br> Col. 11 | $\begin{gathered} \hline 6 \% \\ \text { Int } \\ \text { Col } \\ 12 \end{gathered}$ | Comm | Port <br> Value <br> Col 13 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2/95 |  | 14.12 | 8433 | 843 | 4168 | (63) | 597 | 6700 | (1733) | (890) | 20 | - | 12,601 |
| 3/95 |  | 12.62 | 6742 | 674 | 5083 | - | 534 | 6700 | (47) | 0 | 25 | - | 11,825 |

Now March 95. SHARE PRICE has dropped to $\$ 12.62$ share. Okay, put that SHARE PRICE in column 3 where it belongs. Now go to column 8, SHARES OWNED. Look at column 7, SHARES BOUGHT (SOLD) for last month and you remember you sold 63 shares. Subtract those 63 shares from the 597 you already had and write in your new total of 534 shares.

Okay, back to column 4. Your SHARE VALUE is $\$ 12.62 \mathrm{X}$ your new number of shares $(534)=$ $\$ 6,742$. You should be thinking possible sell. Again put the larger amount on top:

| SHARE VALUE | $\$ 6,742$ |
| :--- | :---: |
| - PORTFOLIO CONTROL | 6,700 |
| = (SELL) ADVICE | $\$ 42$ |
| - SAFE | $\underline{674}$ |
| (SELL) MARKET ORDER | $\$ 0$ |

Again remember to write all the amounts in their proper columns. Or type them all in your little old computer.

I forgot to figure cash so better late than never. Last month's CASH was $\$ 4,168$. So take $\$ 4,168$ and add $\$ 890$ for the stock you sold last month that leaves $\$ 5,058 \mathrm{X} 1.005$ for INTEREST earned $=$ \$5,083, put in column 6. Now just figure PORTFOLIO VALUE which is SHARE VALUE \$6,742 + CASH \$5,083 = \$11,825.

## APRIL 1995

| Date <br> Col. <br> 1 | Remarks Col. 2 | Share <br> Price <br> Col. 3 | Share <br> Value <br> Col. 4 | $\begin{aligned} & \text { SAFE } \\ & \text { Col. } 5 \end{aligned}$ | $\begin{aligned} & \hline \text { Cash } \\ & \text { Col. } 6 \end{aligned}$ | Shares <br> Bought <br> (Sold) <br> Col. 7 | Shares <br> Owned <br> Col. 8 | Port Control Col. 9 | Buy <br> (Sell) <br> Advice <br> Col. 10 | Mrk <br> Order <br> (Sell) <br> Buy <br> Col. 11 | $\begin{gathered} \hline 6 \% \\ \text { Int } \\ \text { Col } \\ 12 \end{gathered}$ | Comm | Port <br> Value <br> Col 13 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 3/95 |  | 12.62 | 6742 | 674 | 5083 | - | 534 | 6700 | (47) | 0 | 25 | - | 11,825 |
| 4/95 |  | 13.12 | 7009 | 700 | 5108 | - | 534 | 6700 | (309) | 0 | 25 | - | 12,117 |

Onto April 95. SHARE PRICE is $\$ 13.12$. Put in column 3 now go to column 8, SHARES OWNED and figure how many shares you own. Always check column 7 from the month before. If you see a meaning you neither bought nor sold any shares, then you know you still have the same number of shares. Last month you know you did nothing, so you know your total stayed the same for SHARES OWNED \& PORTFOLIO CONTROL.

The easy way to figure any month's share total is to add columns $7 \& 8$ from the previous month if you bought and subtract column 7 from column 8 if you sold. So now you own 534 shares. So multiply 534 X the $\$ 13.12$ SHARE PRICE and your SHARE VALUE is $\$ 7,009$, write in column 4 . SAFE is 700. Last month's cash was $\$ 5,083$. This $\$ 5,083$ earned $\$ 25$ INTEREST (column 12) so your ending CASH balance is $\$ 5,108$, write in column 6. Repeat every month, look at PORTFOLIO CONTROL \& SHARE VALUE.

SHARE VALUE is again higher:

| SHARE VALUE | $\$ 7,009$ |
| :--- | :---: |
| - PORTFOLIO CONTROL | $\underline{6,700}$ |
| = (SELL) ADVICE | $\$ 309$ |
| - SAFE | $\underline{700}$ |
| = (SELL) NOTHING | $\$ 0$ |

Only thing left to do is figure your PORTFOLIO VALUE $(\$ 7,009+\$ 5,108=\$ 12,117)$.

## MAY 1995

| Date <br> Col. <br> 1 | Remarks <br> Col. 2 | Share <br> Price <br> Col. 3 | Share <br> Value <br> Col. 4 | $\begin{aligned} & \text { SAFE } \\ & \text { Col. } 5 \end{aligned}$ | $\begin{aligned} & \hline \text { Cash } \\ & \text { Col. } 6 \end{aligned}$ | Shares <br> Bought <br> (Sold) <br> Col. 7 | Shares <br> Owned <br> Col. 8 | Port <br> Control <br> Col. 9 | Buy <br> (Sell) <br> Advice <br> Col. 10 | Mrk <br> Order <br> (Sell) <br> Buy <br> Col. 11 | $\begin{gathered} \hline 6 \% \\ \text { Int } \\ \text { Col } \\ 12 \end{gathered}$ | Comm | Port <br> Value <br> Col 13 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 4/95 |  | 13.12 | 7009 | 700 | 5108 | - | 534 | 6700 | (309) | 0 | 25 | - | 12,117 |
| 5/95 |  | 13.87 | 7409 | 740 | 5134 | +72 sh | 534 | 6700 | (709) | 995 | 26 | - | 12,543 |

Onto May 95. SHARE PRICE is $\$ 13.87$. Since you didn't buy or sell anything last month, SHARES OWNED AND PORTFOLIO CONTROL remained the same. SHARE VALUE is \$7, 409 (534 X $\$ 13.87$ ), SAFE is 740 . CASH was only affected by INTEREST, so add the $\$ 26$ INTEREST earned ( $\$ 5,108$ X $1.005=\$ 5,134$ ). Again check PORTFOLIO CONTROL and SHARE VALUE and again PORTFOLIO CONTROL is lower so PORTFOLIO CONTROL goes on the bottom:

| SHARE VALUE | $\$ 7,409$ |
| :--- | :---: |
| - PORTFOLIO CONTROL | $\underline{6,700}$ |
| = (SELL) ADVICE | $\$ 709$ |
| - SAFE | 740 |
| = MARKET (SELL) ORDER | $\$ 0$ |

All that's left to figure is PORTFOLIO VALUE $(\$ 7,409+\$ 5,134=\$ 12,543$.

## Readjusting Cash/Stock Ratio

We are going to do in an important step to increase our profits - readjust the cash/stock ratio. When we started out, we used $2 / 3$ stock and $1 / 3$ cash. Checking after one year, we find that the percentage of cash has increased. We want to take this excess cash and buy more stock with that. Our PORTFOLIO VALUE was $\$ 12,543.1 / 3$ of that is $\$ 4,139$. Our current cash amount is $\$ 5,134$ so: $\$ 5,134-\$ 4,139=$ $\$ 995$ of extra cash. We use that extra cash to buy the +72 shares you see in the June 1995 spreadsheet entry. That's why you see (709) in BUY (SELL) ADVICE (actual BUY (SELL) ADVICE \& BUY 995 in MARKET ORDER BUY. I wanted to show you what will do. Will fix things up next month.

## JUNE 1995

| Date <br> Col. <br> $\mathbf{1}$ | Remarks <br> Col. 2 | Share <br> Price <br> Col. 3 | Share <br> Value <br> Col. 4 | SAFE <br> Col. 5 | Cash <br> Col. 6 | Shares <br> Bought <br> $($ Sold $)$ <br> Col. 7 | Shares <br> Owned <br> Col. 8 | Port <br> Control <br> Col. 9 | Buy <br> (Sell) <br> Advice <br> Col. 10 | Mrk <br> Order <br> (Sell) <br> Buy <br> Col. 11 | $\mathbf{6 \%}$ <br> Int <br> Col <br> $\mathbf{1 2}$ | Comm | Port <br> Value <br> Col 13 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $5 / 95$ |  | 13.87 | 7409 | 740 | 5134 | +72 sh | 534 | 6700 | $(709)$ | 995 | 26 | - | 12,543 |
| $6 / 95$ | Adjust $\mathrm{s} / \mathrm{c}$ | 15.87 | 9620 | 962 | 4160 | $(61)$ | 606 | 7695 | $(1925)$ | $(963)$ | 21 | - | 13,780 |

Onto June 95. The explanations are becoming shorter because you're getting smarter and seeing how easy this is. The SHARE PRICE rises to $\$ 15.87$ a share. Write it down and then do columns 8 and 9 . Column 8, SHARES OWNED, will increase by the 72 shares we bought last month with the excess cash $(534+72=606)$. Column 9, PORTFOLIO CONTROL increases BY $\mathbf{1 0 0 \%}$ of the
MARKET ORDER BUY amount of $\mathbf{\$ 9 9 5}$. Whenever we first buy or add additional money to the system, we increase PORTFOLIO CONTROL by $100 \%$ - not the usual $50 \%$. Thus column 9 is 6,700 $+995=7,695$.

SHARE VALUE is $606 \mathrm{X} \$ 15.87$ = $\$ 9,620$. SAFE is always $10 \%$ of SHARE VALUE so SAFE is 962. CASH was affected by readjusting our stock/cache ratio. We started with $\$ 5,134-\$ 995$ excess cash + INTEREST of $\$ 21=\$ 4,160$. PORTFOLIO CONTROL is again smaller:

| SHARE VALUE | $\$ 9,620$ |
| :--- | :---: |
| - PORTFOLIO CONTROL | $\underline{7,695}$ |
| = (SELL) ADVICE | $\$ 1,925$ |
| - SAFE | 962 |
| = MARKET (SELL) ORDER | $\$ 963$ |

You have a (SELL) MARKET ORDER. Divide $\$ 963$ by the SHARE PRICE of $\$ 15.87$ and you find that you sold (61) shares. Write in column 7. Then end the month by figuring your PORTFOLIO VALUE. $\$ 9,620+\$ 4,160$ equals $\$ 13,780$.

## JULY 1995

| Date <br> Col. <br> $\mathbf{1}$ | Remarks <br> Col. 2 | Share <br> Price <br> Col. 3 | Share <br> Value <br> Col. 4 | SAFE <br> Col. 5 | Cash <br> Col. 6 | Shares <br> Bought <br> (Sold) <br> Col. 7 | Shares <br> Owned <br> Col. 8 | Port <br> Control <br> Col. 9 | Buy <br> (Sell) <br> Advice <br> Col. 10 | Mrk <br> Order <br> (Sell) <br> Buy <br> Col. 11 | 6\% <br> Int <br> Col <br> $\mathbf{1 2}$ | Comm | Port <br> Value <br> Col 13 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $6 / 95$ | Adjust <br> $\mathrm{s} / \mathrm{c}$ | 15.87 | 9620 | 962 | 4160 | $(61)$ | 606 | 7695 | $(1925)$ | $(963)$ | 21 | - | 13,780 |
| $7 / 95$ |  | 18.12 | 9878 | 987 | 5149 | $(66)$ | 545 | 7695 | $(2183)$ | $(1196)$ | 26 | - | 15,027 |

Onto July 95. SHARE PRICE continues up and is $\$ 18.12$ a share, a good improvement. Now go to column 8, SHARES OWNED and subtract the 61 shares you sold last month from the 606 shares you already owned and you now own 545 shares. That since you sold stock last month, you know PORTFOLIO CONTROL does not change. Now multiply your new SHARES OWNED total of 545 X the SHARE PRICE of $\$ 18.12$ and SHARE VALUE is $\$ 9,878$. SAFE is 987 . CASH went up last month. You had $\$ 4,160$ and sold $\$ 963$; so new CASH total is $\$ 5,123$ which earned $\$ 26$ INTEREST so your new CASH total is $\$ 5,149$, write it down.

| SHARE VALUE | $\$ 9,878$ |
| :--- | :---: |
| - PORTFOLIO CONTROL | $\underline{7,695}$ |
| = (SELL) ADVICE | $\$ 2,183$ |
| - SAFE | 987 |
| = MARKET ORDER (SELL) | $\$ 1,196$ |

You're continuously reducing your risk. You started with 654 shares and now own 479 shares. Divide the $\$ 1,196$ by $\$ 18.12$ and you find you sold (66) shares, write in column 7. Again the last thing you do is figure PORTFOLIO VALUE which is $\$ 9,878+\$ 5,49$ equals $\$ 15,027$, your ahead better than $50 \%$ in just over a year!

## AUGUST 1995

| Date <br> Col. <br> 1 | Remarks Col. 2 | Share <br> Price <br> Col. 3 | Share <br> Value <br> Col. 4 | $\begin{aligned} & \text { SAFE } \\ & \text { Col. } 5 \end{aligned}$ | $\begin{aligned} & \text { Cash } \\ & \text { Col. } 6 \end{aligned}$ | Shares <br> Bought <br> (Sold) <br> Col. 7 | Shares <br> Owned <br> Col. 8 | Port Control Col. 9 | Buy <br> (Sell) <br> Advice <br> Col. 10 | Mrk <br> Order <br> (Sell) <br> Buy <br> Col. 11 | $\begin{gathered} \hline 6 \% \\ \text { Int } \\ \text { Col } \\ 12 \end{gathered}$ | Comm | Port <br> Value <br> Col 13 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 7/95 |  | 18.12 | 9878 | 987 | 5149 | (66) | 545 | 7695 | (2183) | (1196) | 26 | - | 15,027 |
| 8/95 |  | 19.50 | 9341 | 934 | 6377 | (37) | 479 | 7695 | (1646) | (712) | 32 | - | 15,718 |

Onto August 95. SHARE PRICE is up to $\$ 19.50$ PORTFOLIO CONTROL stayed the same, and SHARES OWNED decreased ( $545-66=479$ ), so write them in. $479 \mathrm{X} \$ 19.50=$ a SHARE

VALUE of $\$ 9,341$. SAFE is 934 . CASH is $\$ 5,149+\$ 1,196+\$ 32$ INTEREST, so your new total is \$6,377. Again compare PORTFOLIO CONTROL and SHARE VALUE. SHARE VALUE is higher than PORTFOLIO CONTROL. If SHARE VALUE is higher than PORTFOLIO CONTROL, you have a sell signal. If SHARE VALUE is on top, think $S$ for sell; if PORTFOLIO CONTROL is on top, think P for purchase, it's so simple. Your calculations look like this:

| SHARE VALUE | $\$ 9,341$ |
| :--- | :---: |
| - PORTFOLIO CONTROL | 7,695 |
| = (SELL) ADVICE | $\$ 1,646$ |
| - SAFE | 934 |
| = MARKET ORDER (SELL) | $\$ 712$ |

Divide $\$ 712$ by the selling price and you find you sold (37) shares, write in column 7. Again figure your PORTFOLIO VALUE to end the month. It's $\$ 9,341+\$ 6,377=\$ 15,718$.

SEPTEMBER 1995

| Date <br> Col. <br> 1 | Remarks <br> Col. 2 | Share <br> Price <br> Col. 3 | Share Value Col. 4 | $\begin{aligned} & \text { SAFE } \\ & \text { Col. } 5 \end{aligned}$ | $\begin{aligned} & \text { Cash } \\ & \text { Col. } 6 \end{aligned}$ | Shares <br> Bought <br> (Sold) <br> Col. 7 |  | Port <br> Control <br> Col. 9 | Buy <br> (Sell) <br> Advice <br> Col. 10 | Mrk <br> Order <br> (Sell) <br> Buy <br> Col. 11 | $\begin{gathered} \hline 6 \% \\ \text { Int } \\ \text { Col } \\ 12 \end{gathered}$ | Comm |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 8/95 |  | 19.50 | 9341 | 934 | 6377 | (37) | 479 | 7695 | (1646) | (712) | 32 | - | 15,718 |
| 9/95 |  | 20.75 | 9172 | 917 | 7124 | (27) | 442 | 7695 | (1477) | (560) | 35 | - | 16,296 |

Onto September 95. SHARE PRICE is $\$ 20.75$. Okay, go to SHARES OWNED and PORTFOLIO CONTROL and you know since you sold last month, PORTFOLIO CONTROL stays the same and SHARES OWNED decreases by the number of shares sold. So copy in SHARES OWNED (479 $37=442)$ and PORTFOLIO CONTROL is the same as it was last month. Now multiply 442 X $\$ 20.75$ and your share value is $\$ 9,172$. Looks good doesn't it? SAFE is 917 and CASH is $\$ 6,377+$ $\$ 712+\$ 35$ INTEREST and is now $\$ 7,124$. Again compare PORTFOLIO CONTROL and SHARE VALUE, it's a pleasure. You know what to do:

| SHARE VALUE | $\$ 9,162$ |
| :--- | :---: |
| - PORTFOLIO CONTROL | $\underline{7,695}$ |
| = (SELL) ADVICE | $\$ 1,477$ |
| - SAFE | 917 |
| = (SELL) ORDER | $\$ 560$ |

Have you been remembering to put ( ) around SELL ADVICE and SELL MARKET ORDERS? It's important, go back to last month and check. Again, write the number of shares sold ( 560 divided by $\$ 20.75)=(27$ in column 7). Now for a pleasant chore, figuring PORTFOLIO VALUE. Add \$9,172 + $\$ 7,124=\$ 16,230$.

## OCTOBER 1995

| $\begin{gathered} \hline \text { Date } \\ \text { Col. } 1 \end{gathered}$ | Remarks Col. 2 | Share <br> Price <br> Col. 3 | Share <br> Value <br> Col. 4 | $\begin{aligned} & \hline \text { SAFE } \\ & \text { Col. } 5 \end{aligned}$ | $\begin{aligned} & \text { Cash } \\ & \text { Col. } 6 \end{aligned}$ | Shares <br> Bought <br> (Sold) <br> Col. 7 | Shares <br> Owned <br> Col. 8 | Port <br> Control <br> Col. 9 | Buy <br> (Sell) <br> Advice <br> Col. 10 | Mrk <br> Order <br> (Sell) <br> Buy <br> Col. 11 | $\begin{array}{r} \hline 6 \% \\ \text { Int } \\ \text { Col } \\ 12 \end{array}$ | Comm | Port <br> Value <br> Col 13 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 9/95 |  | 20.75 | 9172 | 917 | 7124 | (27) | 442 | 7695 | (1477) | (560) | 35 | - | 16,296 |
| 10/95 |  | 20.50 | 8508 | 850 | 7722 | - | 415 | 7695 | (813) | 0 | 39 | - | 16,231 |

Onto October 95. SHARE PRICE is $\$ 20.50$. Go to column 8 . Since you sold 27 shares last month, subtract 27 from the 442 shares you previously owned and now you own 415 shares. Write it in. Now SHARE VALUE is $415 \mathrm{X} \$ 20.50=\$ 8,508$. SAFE is 850 . CASH continues to go up. Add the $\$ 560$ from the stock you sold last month to this month's CASH ( $\$ 7,124+\$ 560=\$ 7,684+\$ 38$ INTEREST $=\$ 7,722$ ). Write it in. Again compare SHARE VALUE and PORTFOLIO CONTROL and again SHARE VALUE is bigger. So make the calculations:

| SHARE VALUE | $\$ 8,508$ |
| :--- | :---: |
| - PORTFOLIO CONTROL | $\underline{7,695}$ |
| = (SELL) ADVICE | $\$ 813$ |
| - SAFE | 850 |
| $=$ DO NOTHING | $\$ 0$ |

All that's left is to figure PORTFOLIO VALUE which is $\$ 8,508+\$ 7,723=\$ 16,231$.

## NOVEMBER 1995

| $\begin{gathered} \hline \text { Date } \\ \text { Col. } 1 \end{gathered}$ | Remarks Col. 2 | Share <br> Price <br> Col. 3 | Share <br> Value <br> Col. 4 | SAFE <br> Col. 5 | $\begin{aligned} & \hline \text { Cash } \\ & \text { Col. } 6 \end{aligned}$ | Shares <br> Bought <br> (Sold) <br> Col. 7 | Shares <br> Owned <br> Col. 8 | Port Control Col. 9 | Buy <br> (Sell) <br> Advice <br> Col. 10 | Mrk <br> Order <br> (Sell) <br> Buy <br> Col. 11 | $\begin{array}{r} \hline 6 \% \\ \text { Int } \\ \text { Col } \\ 12 \end{array}$ | Comm | Port <br> Value <br> Col 13 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 10/95 |  | 20.50 | 8508 | 850 | 7722 | - | 415 | 7695 | (813) | 0 | 39 | - | 16,231 |
| 11/95 |  | 19.50 | 8093 | 809 | 7762 | - | 415 | 7695 | (398) | 0 | 39 | - | 15,855 |

Onto November 95. SHARE VALUE has dropped to $\$ 19.50$ share. Go to columns 8 and 9 .
SHARES OWNED and PORTFOLIO CONTROL stayed the same since you didn't buy any stock last month. Write it in. Now multiply $415 \mathrm{X} \$ 19.50$ equals $\$ 8,093$. SAFE is 809 . Last month's CASH was $\$ 7,723+\$ 39$ INTEREST $=$ this month's CASH total of $\$ 7,761$. Now the usual, compare SHARE VALUE and PORTFOLIO CONTROL.

The higher the stock goes, the more profits you can make. Later I'll tell you how to pick the best type of stocks, Closed-end funds, ETF's, and LEAPs (long-term options). The types of investments I would recommend depends on the level of risk you're willing to handle.

Now for those calculations. You see SHARE VALUE is higher than PORTFOLIO CONTROL as you thought. So...

| SHARE VALUE | $\$ 8,093$ |
| :--- | :---: |
| - PORTFOLIO CONTROL | $\underline{7,695}$ |
| = (SELL) ADVICE | $\$ 398$ |
| - SAFE | 809 |
| = DO NOTHING | $\$ 0$ |

The AIM system wants you to sell your high-priced stock, put the money into CASH and sit back and wait for the price to drop. Then you use your cash to buy cheap stock, wait for it to go up and then sell it again; the extreme opposite of a vicious circle. Last thing you have to do for the month this figure PORTFOLIO

VALUE which is $\$ 8,093+\$ 7,762=\$ 15,855$.

## DECEMBER 1995

| Date <br> Col. 1 | Remarks Col. 2 | Share <br> Price <br> Col. 3 | Share Value Col. 4 | SAFE <br> Col. 5 | $\begin{aligned} & \text { Cash } \\ & \text { Col. } 6 \end{aligned}$ | Shares <br> Bought <br> (Sold) <br> Col. 7 |  |  | Buy <br> (Sell) <br> Advice <br> Col. 10 | Mrk <br> Order <br> (Sell) <br> Buy <br> Col. 11 | $\begin{gathered} \hline 6 \% \\ \text { Int } \\ \text { Col } \\ 12 \end{gathered}$ | Comm | Port <br> Value <br> Col 13 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 11/95 |  | 19.50 | 8093 | 809 | 7762 | - | 415 | 7695 | (398) | 0 | 39 | - | 15,855 |
| 12/95 |  | 18.62 | 7729 | 772 | 7801 | - | 415 | 7695 | (34) | 0 | 39 | - | 15,530 |

Onto December 95. SHARE PRICE has dropped to $\$ 18.62$. SHARE VALUE is $\$ 7,729$. Go to columns 8 and 9. PORTFOLIO CONTROL hasn't changed. SAFE is 772. CASH has grown. Last month's CASH was $\$ 7,762+\$ 39$ INTEREST $=\$ 7,801$.

Again compare SHARE VALUE and PORTFOLIO CONTROL and SHARE VALUE is barely ahead. So do your calculations:

| SHARE VALUE | $\$ 7,729$ |
| :--- | :---: |
| - PORTFOLIO CONTROL | 7,695 |
| = (SELL) ADVICE | $\$ 34$ |
| - SAFE | 772 |
| = DO NOTHING | $\$ 0$ |

All that's left of figure is PORTFOLIO VALUE which is $\$ 7,729+\$ 7,801=\$ 15,530$.

JANUARY 1996

Onto January 96. Happy New Year! SHARE PRICE is $\$ 17.62$, continuing down. SHARE VALUE is 415 X $\$ 17.62=\$ 7,314$. PORTFOLIO CONTROL \& SHARES OWNED stayed the same. CASH increases by $\$ 39$ INTEREST to $\$ 7,840$. PORTFOLIO CONTROL is higher than SHARE VALUE. You can quickly see that the difference between PORTFOLIO CONTROL and SHARE VALUE is less than the SAFE total (381 versus 731) so you will do nothing. PORTFOLIO VALUE is $\$ 7,314+$ $\$ 7,840=\$ 15,154$.

FEBRUARY 1996

| Date <br> Col. <br> 1 | Remarks <br> Col. 2 | Share <br> Price <br> Col. 3 | Share <br> Value <br> Col. 4 | $\begin{aligned} & \hline \text { SAFE } \\ & \text { Col. } 5 \end{aligned}$ | $\begin{aligned} & \text { Cash } \\ & \text { Col. } 6 \end{aligned}$ | Shares <br> Bought <br> (Sold) <br> Col. 7 |  | Port Control Col. 9 | Buy <br> (Sell) <br> Advice <br> Col. 10 | Mrk Order (Sell) Buy Col. 11 | $\begin{gathered} \hline 6 \% \\ \text { Int } \\ \text { Col } \\ 12 \end{gathered}$ | Comm | Port <br> Value <br> Col 13 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1/96 |  | 17.62 | 7314 | 731 | 7840 | - | 415 | 7695 | 381 | 0 | 39 | - | 15,154 |
| 2/96 |  | 19.00 | 7885 | 788 | 7879 | - | 415 | 7695 | (190) | 0 | 39 | - | 15,764 |

Onto February 96. SHARE PRICE is $\$ 19.00$, a slight increase. Go to columns 8 and 9 and since you did nothing last month, they stay the same; write them in. Now figure SHARE VALUE, that is 415 shares $X \$ 19.00$ equals $\$ 7,885$. SAFE is $\$ 788$. CASH earned $\$ 39$ INTEREST and since no buying or selling last month, INTEREST was the only thing to affect CASH, thus CASH is $\$ 7,840+\$ 39$ INTEREST $=\$ 7,879$; write it in. Now compare SHARE VALUE and PORTFOLIO CONTROL and SHARE VALUE is still higher. So...

| SHARE VALUE | $\$ 7,885$ |
| :--- | :--- |
| - PORTFOLIO CONTROL | $\underline{7,695}$ |
| $=$ (SELL) ADVICE | $\$ 190$ |
| - SAFE | $\underline{788}$ |
| $=$ DO NOTHING | $\$ 0$ |

Figure PORTFOLIO VALUE which is $\$ 7,885+\$ 7,879=\$ 15,764$.

## MARCH 1996

| Date <br> Col. <br> 1 | $\begin{gathered} \hline \text { Remarks } \\ \text { Col. } 2 \end{gathered}$ | Share <br> Price <br> Col. 3 | Share <br> Value <br> Col. 4 | $\begin{aligned} & \text { SAFE } \\ & \text { Col. } 5 \end{aligned}$ | Cash <br> Col. 6 | Shares <br> Bought <br> (Sold) <br> Col. 7 | Shares <br> Owned <br> Col. 8 | Port Control Col. 9 | Buy <br> (Sell) <br> Advice <br> Col. 10 | Mrk Order (Sell) Buy Col. 11 | $\begin{gathered} \hline 6 \% \\ \text { Int } \\ \text { Col } \\ 12 \end{gathered}$ | Comm | Port Value Col 13 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2/96 |  | 19.00 | 7885 | 788 | 7879 | - | 415 | 7695 | (190) | 0 | 39 | - | 15,764 |
| 3/96 |  | 16.12 | 6692 | 669 | 7918 | 21 | 415 | 7695 | 1003 | 334 | 39 | - | 14,610 |

Onto March 96. SHARE PRICE has hit its one year low. Once you start reading and using Barron's, an excellent financial newspaper, you'll notice the codes they used to show the years high and lows. Go to columns 8 and 9 and they stay the same since you didn't do anything last month. Write them in. Now SHARE PRICE equals $415 \mathrm{X} \$ 16.12=\$ 6,692$. SAFE is 669 . CASH was again only affected by INTEREST so add $\$ 39$ to last month's amount and CASH is now $\$ 7,918$. Compare SHARE VALUE and PORTFOLIO CONTROL and PORTFOLIO CONTROL is higher. So do your calculations:

| PORTFOLIO CONTROL | 7,695 |
| :--- | :--- |
| - SHARE VALUE | $\underline{6,692}$ |
| = BUY ADVICE | $\$ 1,003$ |
| - SAFE | $\underline{669}$ |
| = BUY MARKET ORDER | $\$ 334$ |

So you have BUY MARKET ORDER for $\$ 334$ worth of stock. Divide $\$ 334$ by the SHARE PRICE $\$ 16.12$ and you find you BOUGHT 21 shares. Write this in column 7 - DO NOT put the 21 in ( ). Remember to put a - and column 7 only when you don't buy or sell. Now for the last month, you can probably do it on your own. If you have any doubts, go back and read this chapter again. You can do it!!!!

Last thing to figure is PORTFOLIO CONTROL which is $\$ 6,692+\$ 7,918=\$ 14,610$.

## APRIL 1996

| Date <br> Col. <br> 1 | $\begin{gathered} \hline \text { Remarks } \\ \text { Col. } 2 \end{gathered}$ | Share <br> Price <br> Col. 3 | Share <br> Value <br> Col. 4 | $\begin{aligned} & \text { SAFE } \\ & \text { Col. } 5 \end{aligned}$ | $\begin{aligned} & \text { Cash } \\ & \text { Col. } 6 \end{aligned}$ | Shares <br> Bought <br> (Sold) <br> Col. 7 | Shares <br> Owned <br> Col. 8 | Port <br> Control <br> Col. 9 | Buy <br> (Sell) <br> Advice <br> Col. 10 | Mrk Order (Sell) Buy Col. 11 | $\begin{gathered} \hline 6 \% \\ \text { Int } \\ \text { Col } \\ 12 \end{gathered}$ | Comm | Port Value Col 13 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 3/96 |  | 16.12 | 6692 | 669 | 7918 | 21 | 415 | 7695 | 1003 | 334 | 39 | - | 14,610 |
| 4/96 |  | 18.12 | 7903 | 790 | 7622 | - | 436 | 7862 | (41) | 0 | 38 | - | 15,525 |

Onto April 96. SHARE PRICE is $\$ 18.12$, up $\$ 2$ from last month up. Go to columns 8 and 9 . You bought 21 shares last month so your SHARES OWNED has increased from 415 to 436. PORTFOLIO CONTROL will increase since we did buy stock. Divide 334 by 2 and add that amount to PORTFOLIO CONTROL ( 334 divided by two $=167+7,695$ equals 7,862). Write these two numbers in. SHARE VALUE is $436 \mathrm{X} \$ 18.12$ equals $\$ 7,903$. SAFE is 790 . CASH is $\$ 7,918$ - $\$ 34$ + \$30 INTEREST = \$7,622. Again compare PORTFOLIO CONTROL and SHARE VALUE and SHARE VALUE is slightly higher. Do your calculations:

| SHARE VALUE | $\$ 7,903$ |
| :--- | :---: |
| - PORTFOLIO CONTROL | $\underline{7,862}$ |
| = (SELL) ADVICE | $\$ 41$ |
| - SAFE | $\underline{790}$ |
| = DO NOTHING | $\$ 0$ |

All that's left is to figure is PORTFOLIO VALUE. It's $\$ 7,903+\$ 7,622=\$ 15,525$. So on this example that is a real stock, you would be ahead $55 \%$ for two years. Study this example and you'll see how you make your profit. The stock went steadily up for almost 2 years. Buy low and sell high shouldn't only be a cliché. It should and is put into practice through the system and produces the results you want from an investment.

## OTHER SYSTEM MECHANICS WORTH KNOWING

## - ADDING ADDITIONAL MONEY

I didn't include an example of adding additional money to a stock. It is very easy. If you have for example an additional $\$ 1,000$, you tell your broker to buy $\$ 667$ worth of stock and put $\$ 333$ in your money market account ( on a $2 / 3$ shares, $1 / 3$ CASH type of investment).. Then you increase PORTFOLIO CONTROL by the same amount (667) you bought stock with. Make a separate line on your spreadsheet to show the increase. Change all the columns that need changing. See chart for Claire's Stores at the end of this Chapter for an example. It's very easy to add money to an existing stock. You should do it to increase the size of your investment and decrease the cost of commissions and increase profits. As you read later, you should try to build up to 10 stocks, ETFs, closed-end funds, LEAPs to reduce risk. Also I recommend only adding money to an existing stock when the stock price is at or near its 52 -week low.

## - SKIPPING A MONTH

In several charts in this book, you'll see dashes across one whole month except for INTEREST. For these months you skipped the system - it's not a rigid system you must do every month or whatever schedule you use to check on your investments with AIM. For these months the only thing that happened was earning INTEREST on your CASH. You only needed to write in the INTEREST earned that month and then you added and then next month you can add two months INTEREST the next month when you go back to the system.

## - STOCK SPLITS

Another thing I wanted to tell you. For stock splits, I figured the split after any of the transactions. For example, if you own 500 shares, sold 100 shares and then the stock split 3-for-2 than your calculations were: $500-100=400$ X $1.5=600$ shares now owned. You only need to change the SHARES OWNED column. I have included a blank spreadsheet you can copy in use at the end of the Adobe Acrobat version of my book that you will receive for free after buying this e-book version.

## - READJUSTING THE CASH/STOCK RATIO

One last item. At least once a year, readjust the stock/cache ratio to whatever ratio you are using for your particular type of investment. Different types of investments could have a different ratio between CASH and STOCK. I didn't do that in this chapter except once to keep the example simple. It's easy. Look at Chapters 15 and 16. Once the year I adjusted the stock/cache ratio back to $1 / 3$ cache and $2 / 3$ stock.

If the CASH balance was higher than $1 / 3$ of the PORTFOLIO CONTROL, I took the excess CASH and bought more shares, and increased PORTFOLIO CONTROL by $\mathbf{1 0 0 \%}$ of the CASH amount I used to buy more shares. Look at how I did it and you'll understand. Do this anytime you readjust the cash/stock ratio.

At the end of Chapter 2 in the Adobe Acrobat version of my investing book, you will find a spreadsheet showing Claire's Stores for the entire two years and you will find a blank spreadsheet that you can you can use to set up an Excel spreadsheet to do your investing online.

$55$

䙵

# Chapter 2 A <br> Mechanics of Buying and Selling 

## Part II - Bear Market

In the last chapter you learned the basics of buying and selling. I kept it simple because it's important to learn the system before we go to some advanced technique to improve our profit-making ability. Now I'm going to teach you a simple adjustment to the basic buy and sell system you learned in the previous chapter. This adjustment is needed because of the nature of the stock market.

When I first wrote this book, the stock market hadn't had a sustained bear market in quite a while. It was just recently that I saw the need for this adjustment of the basic buy and sell technique shown in Chapter 2 (I added this chapter right after the last great bear market of 2000, 2001, 2002 - you remember the great dot.com bust. You'll see that this is a very simple refinement and it will protect your CASH during a steep bear downturn.

Okay, what is the change? Well, in the last chapter you learn that every month when you compared PORTFOLIO CONTROL and SHARE VALUE, you take the one with the highest value and subtract the other one:

| PORTFOLIO CONTROL | 5,000 |
| :--- | :---: |
| - SHARE VALUE | $\underline{\$ 3,000}$ |
| = BUY ADVICE | $\$ 2,000$ |

In the last chapter, I taught you then that you look at the SAFE, which is always $10 \%$ of share value. Thus based on Chapter 2, you would finish off your calculation like this:

| BUY ADVICE | $\$ 2,000$ |
| :--- | :--- |
| $-10 \%$ SAFE | -300 |
| $=$ MARKET ORDER BUY | $\$ 1,700$ |

So the system would have you buy $\$ 1,700$ worth of stock. Well, the basic $10 \%$ rule for SAFE for both buys and sells works fine in regular markets. BUT it won't work in an extended bear market because the extended bear market will take all your CASH quickly and you find yourself out of CASH and your stock is still dropping in price. This recently happened to some mighty fine tech stocks and non-techs in early in 2001. (Note: when I used $\mathbf{1 0 \%}$ SAFE, $\mathbf{2 0 \%}$ SAFE etc., in reality I am actually referring to $\mathbf{1 0 \%}$ of SHARE VALUE, $20 \%$ of SHARE VALUE etc.)

These stocks will come back in price but what can we do to save CASH, buy the most possible shares at the lowest prices, and gain the maximum advantage? Well I'll tell you! All we have to do is make a simple little adjustment to the SAFE \% on buys. Instead of arbitrarily using $10 \%$ SAFE for buys, we use an adjustable SAFE percentage for buys in a bear market. Thus compare the example below to our regular $10 \%$ SAFE shown above:

| BUY ADVICE | $\$ 2,000$ |
| :--- | :--- |
| $-40 \%$ SAFE | 1,200 |
| MARKET ORDER BUY | $\$ 800$ |

Thus we have reduced the buy amount from $\$ 1,700$ to $\$ 800$ and conserved our cash. If we had used $50 \%$ SAFE then $2,000-1,500=$ MARKET ORDER BUY of $\$ 500$. I'm going to leave it up to you to decide what percent to use in any given situation. Of course if I'm helping you manage your portfolio I will be glad to give you my advice on what percent you should increase SAFE based on your particular investment. I think my examples in this chapter will help you with the decision.

Below you will see a stock - Caesar's Palace - using both the standard $10 \%$ SAFE and using the adjustable SAFE. In this example I'm arbitrarily picking an increased SAFE percentage based on the sharpness of the price drop - I'm trying to conserve CASH so I can use my last dollar at the lowest price.

In this example, I will also do a little borrowing from other stocks if my CASH does actually run out. I would recommend borrowing as little as possible as I have taught elsewhere in this book. I'm more conservative now and I want to keep borrowing to a minimum. Take a look at Campbell Resources in Chapter 12 and you'll see a borrowing pattern that I don't want to repeat.

Now I'm going to give you a quickie version of what I did with SAFE each month that was not the ordinary $10 \%$ SAFE for buys. Remember we did not change the SAFE percent for sells - we kept it at $10 \%$.

After this explanation are two spreadsheets showing Caesar's using the $10 \%$ SAFE and Caesars using an adjustable SAFE amount. Notice the final totals using both amounts.
$10 \%$ SAFE - PORTFOLIO VALUE $=\$ 50,426-\$ 19,000$ added $=\$ 31,426$
Adjustable SAFE - PORTFOLIO VALUE $=\$ 28,539$

So for a lot less risk, you made about the same profits - also with $10 \%$ SAFE in reality your CASH amount is $\$ 12,791$ - $\$ 19,000$ borrowed or you have a negative cash balance of minus $\$ 6,209$ ). With adjustable SAFE, we have recovered all the "negative cash" and are now in the black.
$(-\$ 1,174)+\$ 3,113$ from the last months sell $=+\$ 1,939$
Here are the months with SAFE greater than $10 \%$ :
February 90 - used 20\% SAFE; price drop from $\$ 32.75$ to $\$ 25.00$
March 90 - used 30\% SAFE; price dropped from $\$ 25.00$ to $\$ 22.25$
April 90 - used $30 \%$ SAFE; price stayed the same $\$ 22.25$; didn't want to buy a lot at the same price, wanted to see if price would continue to drop

May 90 - used $40 \%$ SAFE; price did drop sharply again, from $\$ 20.25$ to $\$ 18.87$
June 90 - used $20 \%$ SAFE; price rose from $\$ 18.87$ to $\$ 22.00$, just bought a few shares
August 90 - used $50 \%$ SAFE; share price had severe drop from $\$ 22.00$ to $\$ 13.62$; still bought $\$ 4,247$ (312 shares) worth, cash went negative, hoping this is near bottom so wanted to "buy low".

September 90 - used $50 \%$ safe; price continued to drop to $\$ 11.37$; still bought $\$ 3,423$ ( 301 shares) worth, wanted to get cheap shares and hope slide is over.

October 90 - used $30 \%$ SAFE; price rose slightly to $\$ 12.25$, still bought a few shares $-\$ 1,485$ or ( 121 shares) cause this is still a great price to be buying shares - we are negative in cash to $(-\$ 6,028)$.

Now looking at the spreadsheet you'll see the "bear market for Caesar's" ended here and we could go back to normal. You see by June 91, we have recovered all our cash and you'll see we have made a profit, going from $\$ 23,955$ in October 89 (top of the spreadsheet) to $\$ 28,539$ in June 91 . This despite the fact that the price of Caesars stock was $\$ 35.12$ in October 89 and in June 91 is only $\$ 24.37$, a $31 \%$ drop in price.

Again you see the beauty of the system. But because of "bear markets" we need to add another tool to our AIM arsenal in our war with the stock market. Also note in old days paid much higher commissions - thus for adjustable AIM spreadsheet, I used newer lower commission rate of $\$ 12$ - flat rate for up to 5,000 shares.

Please read my new material at the back of this Chapter. Notice Caesars stock prices were taken in the early 1990s - all we had then was a very brief bear drop. But in the last years - 2000 - 2003 we had a severe bear market, very severe and the AIM bear adjustment had to be modified so AIM could even handle a severe bear market! These adjustments are not necessary IF you have a lot of spare cash lying around and don't mind adding it until the bear stops growling... But you better have very deep pockets - see Allis Chalmers in Chapter 7!! And see Campbell Resources in Chapter 12.

Here in the Adobe Acrobat free book you will find a spreadsheet showing Caesar's using 10\% SAFE \& a second spreadsheet using an adjustable SAFE.

Note: this note from Ron inspired me to add my thoughts on how much to adjust AIM for the different kinds of stocks. See my thoughts below Ron's insightful note.

Hello Fellow AIMers: Readers of my notes know by now that I don't pretend to be an expert. The other ladies and gentlemen who contribute to this great newsletter really know their stuff. They have refined Mr. Lichello's original formula to peak performance. I'm just another small investor like many of you out there who read this and was impressed by the system and continue to marvel at how good it works. I am honored that they let me throw in a few thoughts. When I send in my notes every month I have no idea what will accompany me in this newsletter. Last month I posed the question, what do we do in a bear market when prices get so low we run out of cash. Well apparently this has been on many peoples minds, and it sure has been on Jeff's.

He added a great new chapter in his book where he has increased his SAFE from $10 \%$ to possibly $50 \%$. I urge you all to read it here, it's great! Just when you think these guys can't refine AIM any more they do it again. I am 40 years old and like many of you most of my investing life has been in a bull market. So this extended bear market is both new and hard for me. Now when I first read about the split SAFE, another great refinement that swayed towards ELIMINATING the buy SAFE for bull markets, especially mutual funds which tend to always go higher eventually, this really makes sense to me. So what does this tell us? How do we know how much or which way to adjust this SAFE figure. To me it seems we have to adjust it to the market and each individual equities personality. Look at each stocks' 52 -week high and low and get the feel of it. There is no set way of determining this. Perhaps we all should learn a little technical analysis and look at a few chart patterns. AIM is a great tool, but remember no tool is any good unless you make it work. So friends this bear market isn't all bad. It taught us AIMers a great refinement. Change the SAFE to fit your needs.

## Jeff's thoughts on stock's personalities

Ron came up with a great way of viewing stocks I hadn't thought of. Yes, I feel stocks do have "personalities" just like people. And we need to view these personalities to figure out how these stocks are going to behave in a bear market. In reality it's the "personality" of investors holding the stocks that decides whether we have a wild one or a mild one.

Here are my quick thoughts on the different stock personalities and how to handle them in a Bear Market:

## The Conservative Personality:

The conservative ones are the Blue Chips of the world - these are the Dow Jones Industrial Average Stocks. These stocks have been around forever, these stocks made it through the Great Depression of the 1930s. You've probably heard of some of these: IBM, DuPont, American Express, CitiGroup, CocaCola etc.

These stocks will not show such drastic plunges - a good example is my Dow Jones Model Portfolio never had to increase SAFE \% with those stocks - while had great increases with the Techs in the "Conservative" portfolio. These stocks normally do not even show highs and lows greater than $100 \%$ in a year. Thus tocks with the conservative personality will not require very radical changes in AIM during a Bear Market. You might wind up upping your SAFE amount to $20 \%$ instead of the normal $10 \%$ of share value. Again like Ron says, it helps to do a little work yourself. One reason I post the highs and lows for stocks for a stock for the prior few years is to give you an idea of the personality of the stock. I feel most of these stocks will not require radical AIM surgery during a Bear Market.

## The Radical Personality:

I feel I should apologize to you for calling my Conservative Portfolio my Conservative Portfolio. It has been anything but conservative in this bear market. I originally felt it was conservative compared to other high techs - primarily the content high techs like iVillage, Dr. Koop, eToys etc. I felt content providers would come and go (I did recommend ones I thought had a chance to succeed). I felt the hardware providers - the Ciscos, Sun Microsystems, Lucent Technologies would always succeed. And they probably will - but they will give you a heck of a ride. Based on my experience with Cisco \& Sun - I will give you new "fight the bear" info 0r "Son of Bear Market" - how to Turbo-Proof AIM when the unthinkable like the tragic World Trade Center Terrorist Attack occurs. At the end of the chapter, I will show you Cisco \& Sun through this disaster and how I tried to "Bear-Proof" what was left of them. Again
like Ron, I was a little late to catch on but like he said, learn from your mistakes and be ready for the next unspeakable horror - I'll show you what I did.

I knew these "Radicals" did have bigger swings in high/low prices but I underestimated investor's foolishness in dumping these stocks for huge losses - again I fell victim to underestimating the stupidity of investors. I won't do that again.

Now I have a better grasp on how these "high techs" will handle in a Bear Market. So here are my new thoughts on how AIM should handle these stocks.

The one way to easily distinguish conservative and radical personality stocks is the high/low differences they have. As I said above, conservative/Blue Chip/Dow Jones stocks rarely have high/low differences greater than $100 \%$. But our radicals, even the radicals I thought were conservative - that's why I called the portfolio conservative - exhibit high/low differences significantly higher. Cisco's high was 82.00 ; low was 20.31 for a $304 \%$ difference; Sun's high was 64.66 ; it' low 17.00 for $280 \%$ difference; and Lucent's high was 66.62 ; it's low 9.81 for a $579 \%$ difference.

It's these differences that require adjusting AIM so as to not exhaust our cash too soon. remember by going $2 / 3$ stock, $1 / 3$ cash we don't have a lot of leeway and we want to make the most of buying as low as possible. So in addition to the advice earlier in this chapter, here are some additional ideas for radical stocks:

## Rules \# 1 - use a $\mathbf{2 0 \%}$ SAFE ( $20 \%$ of Share Value) for all buys right from the start.

I am saying do this from day one when you own a "high tech"/radical-type stock. You don't change the SAFE 10\% Sell amount. Also during sells let the cash build up.

Rule \# 2 - when you adjust Stock/Cash amount on radical stocks, only use half the amount the calculations say:

For ex: If Stock Value is $\mathbf{3 , 0 0 0}$ and cash is 3,000:

Normally your calculations are 6,000 X $1 / 3=2000$ cash and you have 1,000 extra cash and buy 1,000 worth of stock. For radical stocks, just buy 500 more and leave that extra 500 in the cash account as a cushion.

## Rule \# 3 - keep extra cash in your money market for outstanding buy opportunities

Let's say you are going to start with $\$ 15,000: \$ 10,000$ in stock and $\$ 5,000$ in cash. If you have an extra $\$ 5,000$ to put in your Money Market Account - do it!

Rule \# 4 - you can always follow Robert Lichello's original investing strategy - $\mathbf{5 0 \%}$ Stock, $\mathbf{5 0 \%}$

## Cash...for Radical Stocks

I want to emphasize I still think high techs and others on the NASDAQ are good stocks and are our future for America. What we are experiencing now is just a typical Bear Market affecting both good and bad stocks. Again remember the words of J. Paul Getty: "buy when the news is bad."

The real world is the best lab so below I'll show you what the Bear did to Cisco and Sun. It's not pretty, but both as well as many other "techs" have recovered significantly from the tragic events of September
11. Check the two spreadsheets for Turbo-SAFE - I had to stop the bleeding so I took radical action on radical stocks.

Cisco Systems from Model Portfolio

## Jeff's Latest Ideas on Adjusting for Bear Markets

I started managing stocks for one of my friends, I have learned a thing or two. First I learned that I didn't make this chapter as clear as possible. And I'm sorry for that. But the beauty is I can fix that right now and I will continue to make this book better and better with your help. Please send your questions or ideas for improving this or any chapter in my book. Let's make this the best book we can!

I want to explain to you how I arrived at the Variable SAFE amounts I used earlier and used for two of the stocks I now manage for my friend. I think the way I used different SAFE amounts earlier and was confusing the benefit show was hard to see when Caesar's using standard $10 \%$ SAFE finished at about $\$ 53,000$ and the Variable SAFE Caesar's finished at about $\$ 28,000$ !

One investor wrote me with some very wise questions and he showed me I need to explain in more detail the Variable adjustments I made and show that anyone can make these same type adjustments easily when you see what the adjustments are doing. Please read below and look at the two current spreadsheets with real live stocks I am actively managing for a fellow investor: If you would like me to personally advise you monthly, please email me and I will explain what I can do for you. Email me at: jeffee@t-online.de

Hi, Jeff, thank you for your follow-up regarding Chapter 2A. I have spent some time reviewing the chapter and Imust admit that there are several things that bother me about it:

Your safe value choice was optimal. The use of a "Split Safe" is not automatic. A lot of empiric guessing enters into the equation by using various split safes. Who is to say or its very use was correct? Perhaps it isn't.

Dave, you probably looked at the two stocks (see spreadsheets at end of Chapter)I sent you and have this question as well as reading Chap 2A. I probably need to revise Chap

2A so all readers know it is not as complicated as it appears. Of course we know it only applies to buys not sells - sells are always $10 \%$.

On the two stocks I sent you - you see different SAFE amounts with quite a range of difference. So how did I arrive at the adjusted SAFE amounts? Pretty easy! After I subtract SHARE VALUE from PORTFOLIO CONTROL and see a large difference (much higher than $10 \%$ - what I do is divide the $10 \%$ share value (what we normally subtract) by the MARKET ORDER BUY AMOUNT and then make my SAFE AMOUNT equal to that \% so the investor does not buy any that month or buys only about the $\$ \$ \$$ amount he would be buying if it were a normal $10 \%$ regular SAFE month. I always want to have $\mathrm{a}+$ cash amount so if the stock really goes down, the investor still has some cash left to buy the cheapest possible stocks.

I will give two examples from the stocks I am managing and I will send you the spread sheets:

Look at SUN MICRO: Originally started with $\$ 872$ cash (1/3 of PORTFOLIO VALUE)

Made 3 buys: Sep, Oct, Nov 02 - rock bottom of the Bear Era, but look at the starting PORTFOLIO CONTROL. My investor had managed his own stocks earlier so when I got them, they had really dropped - so I only wanted to buy about the $10 \%$ - so in Sep 02 PORTFOLIO CONTROL was 3,150 - SHARE VALUE \$1,685 = BUY \$1,465 $10 \%$ SAFE (168) = MARKET ORDER BUY - \$1,297!

So what did instead was divide the BUY AMOUNT $(\$ 1,465)$ by $168=87 \%$ SAFE not $10 \%$ SAFE. So what I did was reduce the $87 \%$ SAFE amount down to $80 \%$ and buy a little over $\$ 100$ worth of stock that month.

Next month Oct 02 - SUN drops to $\$ 2.85$ - so glad I saved cash the month before. Again I divide BUY ADVICE 1948 by 10\% SAFE amount $126=155 \%$ SAFE. I still want to make a buy so by lowering the SAFE amount to $140 \%$, I still get to buy 65 shares
at $\$ 2.85$ AND STILL KEEP CASH IN THE ACCOUNT. What I am trying to do is be very conservative with a highly risky stock until it stabilizes. The easy way to see if a stock is highly risky is to look at its BETA. A stock with a BETA of two swings high or low 2X more than BETA stock of one - so any stock with a BETA over 1 has higher highs and lower lows than a BETA 1.0 stock.

In SUMMARY - what I am trying to do is roughly only buy the $10 \%$ or make SAFE high enough so there are no buys. Look at Jul 03 - SUN rises to $\$ 4.72$; rising stock now - so I certainly don't want to buy shares at $\$ 4.13$ when it was $\$ 2.74$ about six months. I make my SAFE high enough so there is NO buy that month. So PORTFOLIO CONTROL is 3,359 - SHARE VALUE 2,263 = 1096 BUY ADVICE. I want a SAFE AMOUNT HIGHER than BUY ADVICE of 1096 so by dividing the 1096 amount by the $10 \%$ SAFE AMOUNT of 226 I quickly find that if I use $50 \%$ ( 5 X the normal amount) I do not have a buy. I have to be patient and wait for this stock to go higher because the SHARE VALUE is still very low but is climbing - so I don't want to buy when a stock is rising after a big fall. The investor patiently waits.

Now there are other variables that can be adjusted. But look in Chapter 7 at Allis Chalmers done many years ago in the '80s before my Bear adjustment. Look how much extra cash you had to pump in the make every buy required - that's OK - If you have deep pockets but I feel most investors don't. I wanted a way to conserve the cash and adjusting the SAFE amount does just that.

Dave's additional comment: The beauty of AIM is lost and AIM now becomes more a matter of subjective interpretation of the market. This may be counterproductive if your market interpretation actually goes against a developing trend --the human error factor.

Yes, a little of the beauty is lost but the cash saved and used later to buy even cheaper shares restores the lost original beauty and makes the stock more beautiful than ever. The true beauty of AIM used to MAX is to have a manipulation in the formula when you
have a serious Bear Market. The beauty of driving a nice car is not lost because you have to stop at a red light. That red light lets you live to drive your car another day.

Also, almost all investors no matter how many times I tell them they must never let emotions overpower them in either a BULL or BEAR Market really start to panic when their stock runs out of gas. My friend who I managed for was to sell everything he had left last Aug 02 - in the year applying the Variable SAFE Amount, his portfolio is up $35 \%$ \& most of that year was very Bearish.

One time while experimenting with the AIM formula I tried using 0\% SAFE - making BUY ADVICE \& MARKET BUY the same amount - boy, do you need to pump in a lotta extra cash to make all the AIM buys doing that - I concluded that system would only work for Bill Gates, Mayor Bloomberg \& a few others. So that never found its way into my book - far too risky for the average investor.

And that's who I write for - all I am doing is making AIM safer during Bear Markets. And I think that is a beauty of AIM.

So look at the spreadsheets for two currently managed stocks that were wounded but not killed by the Bear and I will explain why I made the Variable SAFE amounts and were the variable SAFE amounts came from - no, not my crystal ball - that' just for advice!!

I will now talk about the two current real stocks at the end of this chapter and I will explain the using a Variable SAFE is fairly easy and explain how I made my decisions for a couple of the buys and "do nothings"

The absolute bottom for the Bear Market was Oct, Nov, Dec 2002. First lets look at Sun. I inherited Sun Micro in Aug 02 after my friend had been managing it, he was a little discouraged to say the least about Sun's performance before Aug 02. So at $\$ 4.21$ in Aug 02, PORTFOLIO CONTROL was 3150 and SHARE VALUE was 1743 so Sun roughly has to double to $\$ 7.60$ before SHARE VALUE will equal PORTFOLIO

CONTROL and you will be in the "do nothing" zone and will have to go up to roughly $\$ 10.00$ a share before you will have a SELL MARKET ORDER.

So I wanted to be very conservative for my friend - this is his retirement money and we still had some cash to work (basically at this point since my friend had extra cash). We agreed to set up each stock as if just bought but keep the old PORTFOLIO CONTROL because that was $100 \%$ relevant to any buying, selling or doing nothing we needed to do. So for these 2 stocks and the others, I started with $2 / 3$ stock and $1 / 3$ CASH. So Sun Micro started with \$1,743 SHARE VALUE and $\$ 872$ CASH.

So when Sep 02 came along, I used a high enough SAFE amount $80 \%$ or 8 X normal SAFE ( $10 \%$ SAFE 168 X $8=1,344$ ) to make sure I only made a small buy because we were still in a down market. Save the extra cash for the next month.

Next month Oct 02, Sun is still going down (remember when it was in the 100s?) and drops sharply to $\$ 2.85$. Again we want to conserve cash (again if you have lots of spare money, and can stand high risk, I do recommend you only use $10 \%$ SAFE regardless and when the stock turns around your profits will be much higher (see Caesar's example earlier in this chapter. But if you are Conservative, don't want to any or very much additional money into your stocks, follow my guidance here.)

So at $\$ 2.85$, I want to buy some at this price but still want to be very conservative. I use $140 \%$ SAFE ( 14 X 10\% SAFE of 126 = 1,764 AND buy \$ 189 of Sun or 65 Shares. Same next month, want to buy some SUN but only about the $10 \%$ SAFE amount so I use $180 \%$ SAFE ( 18 X $10 \%$ SAFE of $139=1,807$ ).

Now look at the remaining months: Sun has started back up like all of my friends stocks and many, many more on both the New York Stock Exchange and the NASDAC. But it hasn't go up enough to sell for a profit yet because of high PORTFOLIO CONTROL from the Bear days. So I want a high enough SAFE so we don't do anything until Sun truly recovers. And I don't want to use any of the remaining cash to buy more shares because it is going up, not down. I still want my cash in case Sun slips once or twice on
its forthcoming recovery. So while you see different variable SA FE amounts from Dec 02 to Jul 03, all I was doing was dividing BUY ADVICE amount by $10 \%$ SAFE and get a variable SAFE high enough so we did nothing. For ex. Dec 02 - BUY ADVICE is 1238 so 1238 divided by $=58 \%$ SAFE. So all I did was round up to $60 \%$ SAFE and we "do nothing". Other months are the same.

Now I explain Nortel quickly. Same rational as Sun, I want to protect cash and buy at the lowest points. I make SAFE high enough in Sep 02 so I do not have a buy because Nortel went from $\$ .85$ to $\$ 1.25$. But I wasn't convinced the overall Bear Market was over so I wanted to be cautious with a risky stock. As I say elsewhere in this book, when a stock drops below $\$ 3$ it is risky but many better stocks that are not "Pennystocks" can drop below $\$ 3$ and will rebound. So I was very cautious with this stock - remember I have been charting stocks during the previous Bull Markets for many years and for the past 3 years or so, been charting them in a bad Bear Market. You will gain experience and become better and better the longer you do your monthly charts. And as I said above, I will be happy to get you started by helping you for a while - just email me at jeffee13@hotmail.com

So I used a variable SAFE of $170 \%$ (17X 10\% SAFE of $168=2856$ ) so higher than BUY ADVICE of $2943=$ MARKET ORDER BUY ignore 87. Now glad skipped buy in Sep 02 because Nortel goes down sharply next two months and again I use variable SAFE amount but do want to make small buys and get more shares. Look at remaining months - Dec 02 - Jul 03 - Nortel has more than tripled from its low of \$.63-we even had a SELL of 228 shares in July 03 (at the regular 10\% SAFE). Again all the SAFE when you see a number were higher than $10 \%$. When you see the REMARKS column blank, I was using the regular 10\% SAFE and MARKET ORDER BUY told us do nothing. Again, if you have any questions please email me at jeffee13@hotmail.com and anytime I see a problem, I will again modify this chapter.

## Chapter 3 Philosophy of Success

This chapter has nothing to do with the system itself and yet it has everything to do with it. As important as having investing strategy, is having a success strategy. You might know it as a positive mental attitude, positive thinking, whatever. I see it as a burning desire to succeed, total faith in yourself. The Bible tells us that faith can move mountains and you need that kind of faith to succeed. You need an inner faith in yourself to get the most out of this system and life itself. No more preaching, just a list of books and tapes I recommend. Most of these are timeless classics that will not only benefit and delight you, but will transform you in all areas of your life.

Here are the books and tapes I recommend - most old, used bookstores or Amazon online have these books at very reasonable prices:

Think and Grow Rich by Napoleon Hill
University of Success by Og Mandino
Power of Positive Thinking by Dr. Norman Vincent Peale (any book or tape by Dr. Peale is outstanding)

How to Wake Up the Financial Genius Inside You by Mark O. Haroldsen
How to Win Friends and Influence People by Dale Carnegie
The Magic of Thinking Big by David J. Schwartz
Ultimate Secrets of Total Self-Confidence by Dr. Robert Anthony
The Sky's the Limit by Dr. Wayne Dyer
Psychocybernetics by Dr. Maxwell Maltz

I have also found many success oriented tapes including tapes of some books I listed. Tapes are an excellent, easy, and powerful method of transforming yourself into a successful person. An excellent organization offers most of these tapes. Write to:

Success Motivation Institute, Incorporated
P. O. Box 7614

Waco, TX 76710
Another excellent source of tapes is an organization called Sybervision. Write them for their catalog or look them up online. They offer both personal development and support improvement tapes. I have bought two programs from them write to:

Sybervision
Fountain Square
6066 Civic Terrace Ave.
Newark, California 94560
If you're motivated to earn money from the system, I think you're also motivated to improve yourself and vice versa. I really believe this is necessary and so worthwhile. This is probably the best thing you can ever do for yourself. As Mark Haroldsen said so wisely in his book: "Pay yourself first".

## Chapter 4

## Investment Books for Fun and Profit

I have read many investment books - some good, some bad, some useful. Like you I was always searching for the ideal investment method that would work on a limited budget. I finally found it in How to Make \$1,000,000 in the Stock Market Automatically by Robert Lichello. I instantly realized this was the ideal system. I tried to think of ways to use the system.

This led me to write this book because I felt my ideas could and should benefit as wide an audience as possible. Below are other investment books I recommend for many reasons - knowledge, wisdom, and enjoyment. Starting out I'll recommend a couple of books that quickly explain all investments - alias reference books:

These are the books I recommended approximately 16 years ago and I think they're still good today because they're timeless and been updated. After I've listed all these books from a long time ago, I list some of the latest books I've read that are also excellent.

Successful Investing by the staff of United Business Services
New York Times Complete Guide to Personal Investing by Gary Klott
Here are some other books on investing I enjoyed:
How to Make the Stock Market Make Money for You by Ted Warren
How I Turned \$1,000 into a Million in Real Estate in my Spare Time by William Nickerson

All America's Real Estate Book by Carol Janik and Ruth Rejinis
A Treasury of Wall Street Wisdom by Harry Schultz and Sampson Coslow
You only Have to Get Rich Once by Walter Gutman
How I Made \$2,000 000 in the Stock Market by Nicholas Darvis

Confessions of a Stockbroker, a Wall Street Diary by Brutus
Reminiscences of a Stock Operator by Edwin Lefevre
The Hidden Stock Market (How to Pick \$5 Stocks that Can Double in 6-12 Months by Ira V. Cobleigh

Contrary Investing for the 90s, How to Profit by Going Against the Crowd by Richard E. Band

101 Years on Wall Street, an Investor's Almanac by John Dennis Brown Beating the Dow by Michael O'Higgins with John Downes

And here are the latest books that I highly recommend, I'm going to walk out to my sunroom and pick them down off the shelf as I save books like a hoarder and I will give you their names and authors:

The Black Swan, the Impact of the HIGHLY IMPROBABLE by Nassim Nicholas Taleb
Options for the Stock Investor by James B. Bittman
LEAPs, What They Are and How to Use Them for Profit and Protection by Harrison Roth

Small Stocks Big Profits by Gerald W. Perritt
Investing with Exchange-Traded Funds Made Easy by Marvin Appel
The Match King by Frank Partnoy
Investment Gurus by Peter J. Tanous
The Motley Fool Investment Guide by David and Tom Gardner
Investment Psychology Explained by Martin J. Pring
Contrarian Investing by Anthony M. Gallea \& William Patalon III
Winning on Wall Street by Martin Zweig
Where Are the Customer's Yachts by Fred Schwed, Jr.

Secrets for Profiting in Bull and Bear Markets by Stan Weinstein
The ETF Book by Richard A. Ferri, CFA
The Panic of 1907 by Robert F. Bruner \& Sean D. Carr
Options and Option Trading by Robert W. Ward
Options Trading for the Conservative Investor by Michael C. Thomsett
You Can Be a Stock Market Genius by Joel Greenblatt
Dow Jones-Irwin Guide to Put \& Call Options by Henry K. Clasing, Jr.
Four books stand out in my memory as really profound - I list them below with a little commentary:
Wealth without Risk by Charles Givens - an excellent guide for complete financial management that will free up money for investing by giving excellent advice on how to save money and live just as well.

All You Can Do is All You Can Do by A .L. Williams - an excellent "rags to riches" story and blueprint for successful thinking.

Your Money or Your Life by Joe Dominguez and Vicki Robin - learn to live frugally without decreasing your lifestyle. Shows you how to live on much less and be much happier doing it. Will create a new wonderful lifestyle that will end the rat race of pay raises never keeping up with expenses.

Winning Big with Bargain Stocks by Bill Matthews - this book is mandatory, tells you exactly the type of stocks we want and gives excellent vice on how to pick them.

He also publishes or used to publish a monthly newsletter that was very helpful. Write to or look them up on the Internet:

Bill Matthews, Editor
Matthews and Associates, Incorporated
2549 W. Golf Rd., Suite 350
Hoffman Estates, Illinois 60194

The book cost $\$ 1695$ when I wrote this and he'll be glad to autograph it. His newsletter is called The Cheap Newsletter.

Also I found a very good investment book club you might like to join. It is called the Fortune Book Club - look them up on the web but I'm sure you'll find they have a nice online site where you can join and peruse the type of investing books they offer - heck after 16 years in 2011 I'm sure they offer e-book versions of books.. And again I'd like you to remember that with any good broker and I know for a fact TD Ameritrade offers free Standard \& Poor's online reports that give you an up-to-the-minute eight-page analysis of most of the important New York, American and NASDAQ stocks.

## Chapter 5 <br> Seven Rules for Success in the Stock Market

I saw an ad in Barron's listing seven rules for success in the stock market. I'm going to show you how the system incorporates these rules for success.

## 1. Know What to Buy - When

The system incorporates the right type of stocks for us small investors (see Chapter 8 on how to pick stocks). Also the system has flexibility on when to buy. I personally like the idea of buying a stock initially when the stock is at or near its 52 -week low because it should greatly increase profits. Also closed-end funds, ETFs and LEAPs work well in the AIM system.

## 2. Know What Not to Buy

The system shows you what not to buy. Normally don't want to buy stocks that don't fluctuate, (show a wide range between the year's high and low price), stocks with large dividends, (a big exception to that is when you buy closed-end funds that are income oriented and pay high dividends), and regular mutual funds.

## 3. Know When to Sell and Buy

The system shows you exactly when to buy and sell and how much to buy and sell. The system also shows you when you should do nothing.

## 4. Know How to Measure Risk

The system works well at all risk levels. You can choose the type of stocks, ETF's, LEAPs in your system to suit any risk level you feel comfortable with.

## 5. Know How to Diversify

I'll show you how to select the rounded 10 investment portfolio that will make allowances for individual fluctuations and will give you profits year after year.

## 6. Know which Industry Sectors to Select

I will show you a couple of industry sectors I like and will work well with the system. Three I liked many years ago and still like are gambling, high tech, and biotech. Also for conservative investors, blue-chip stocks have a lot to offer. You basically want industries that are viable for the long term and sometimes you can take a risk with a new technology that will pay off someday like solar power. Very recently most solar companies crashed and their stocks are at very low prices. If you're patient and waited out they could give you a handsome reward in 5 or 10 years playing AIM.

## 7. Reap the Rewards of Compounded Appreciation

This is the best part of the system. You'll get good returns in both dollars and percent in the early years. But after a few years, you get unbelievable benefits from compounded interest. You want to see the benefits of compounded appreciation, take the $30 \%$ average return and extended out 12 years and see how much money you have. Here is $\$ 10,000$ compounded at $30 \%$ for 12 years: again you will need to look in your Adobe Acrobat version and you will find a very nice spreadsheet showing compound interest for 12 years. I'll break the suspense and let you know if you compound $\$ 10,000$ for 12 years at $30 \%$ you have $\$ 232,981$ !

And it will keep growing. This is a realistic estimate of the gains you can make under the system if you faithfully follow the system and work at picking the best stocks, ETF's, closed-end funds and LEAPs for the AIM system.

Think of compounding this way: in the above example, we started with $\$ 10,000$ and at the end of 12 years accrued to $\$ 232,981$ or your money grew 23.3 times the starting amount of $\$ 10,000$.

This means that every dollar you invested 12 years ago is now worth $\$ 23.30$. So spend that dollar now and you throw away $\$ 23.30$ of your future 12 years later. Now you see the value of compounding. Use it for your future too.

| \$10,000 Compounded at $\mathbf{3 0 \%}$ for 12 years |  |  |  |
| :---: | :---: | :---: | :---: |
| Year | Starting Amount | 30\% Compounded | Total Worth End of Year |
| 1st Year | \$10,000 | X $1.3=$ | \$13,000 |
| 2nd Year | \$13,000 | X $1.3=$ | \$16,900 |
| 3rd Year | \$16,900 | $\mathrm{X} 1.3=$ | \$21,970 |
| 4th Year | \$21,970 | X $1.3=$ | \$28,561 |
| 5th Year | \$28,561 | X 1.3 = | \$37,129 |
| 6th Year | \$37,129 | X $1.3=$ | \$48,268 |
| 7th Year | \$48,268 | X $1.3=$ | \$62,741 |
| 8th Year | \$62,741 | $\mathrm{X} 1.3=$ | \$81,731 |
| 9th Year | \$81,731 | X $1.3=$ | \$106,045 |
| 10th Year | \$106,045 | X 1.3 = | \$137,858 |
| 11th Year | \$137,858 | X $1.3=$ | \$179,216 |

| 12th Year | $\$ 179,216$ | X 1.3 $=$ | $\$ 232,981$ |
| :---: | :---: | :---: | :---: |

And it will keep growing. This is a realistic estimate of the gains you can make under the system if you faithfully follow the system and work at picking the best stocks and close-end funds for the system. You have to hang in there in the early years and keep reinvesting profits back into the system (always pay yourself first and don't touch that money).

Think of compounding this way: in the above example you started with $\$ 10,000$ and at the end of 12 years it grew to $\$ 232,981$ or: \$232,981
$\$ 10,000=23.3$

## Chapter 6 How I'm Doing for My Investors

I have recently started helping investors manage their portfolios using my latest bear management tools covered in Chapter 2A. For one portfolio I have managed for the past 15 months, results are very impressive: Jim's portfolio has risen $108 \%$ in 15 months!!! This portfolio has risen from a starting value of $\$ 75,042$ in August 02 to its current January 04 value of $\$ 156,124$. It rose $\$ 31,783$ in January 2004 alone!!

In the upcoming months in 04 will be just as good because I helped him from the depths of the bear market.

And the upcoming month in 04 will be just as good because I help them from the depths of the Bear market. Look at the attached spreadsheets (again you will have to look in your Adobe Acrobat version and you will find spreadsheets on 13 stocks (ironically I was born on Friday the 13th but I didn't deliberately plan to give you 13 stocks worth the spreadsheets here. The spreadsheets are worth 1,000 words each!!

You will notice that several stocks are listed twice. That occurs because we bought the same stock at different times and thus each one is managed differently. Just look at the PORTFOLIO VALUE columns and see if you would like your stocks to have similar PORTFOLIO VALUEs. I will help any investor manage their portfolio, just e-mail me for information at jeffee13@ hotmail.com

Again all the spreadsheets for this chapter are in the free Adobe Acrobat book you get for buying my e-book.

## Chapter 7

## The Good, the Better, the Best

This system will help you with all kinds of stocks. I picked three different types of stocks to show you how the system gives you the opportunity to make money while protecting your nest egg. (Note: the printed version of the book contains three colored graphs and several other spreadsheets that will be found in the Adobe Acrobat version but not in the e-book version.

## The Good

Allis Chalmers is the classic example of a stock that goes down, down, down and never comes up above its original price for air. The price started at $\$ 10.37$ a share in November 1984 and in March 1987 was wallowing at $\$ 3.12$ a share for a $70 \%$ drop since it was charted. The stock has done so poorly that an additional $\$ 21,000$ in cash had to be pumped in to buy when the system said to buy. You're definitely taking a chance with a stock like this. No method of investing, even the AIM system can save you if the stock dies - ask the Enron stockholders.

If Allis Chalmers or any stock, or ETF bounces back at all, then you really stand to profit. Let me show you why. Since under the system you're always buying shares at lower and lower prices; if the stock really goes in the tank, you'll pick up lots of shares very cheap. As a result with Allis Chalmers, you have grown from 643 shares to 8,313 shares, almost a $1293 \%$ increase in shares owned.

All the shares were purchased at cheaper and cheaper prices and this cheaper stock averaged with your original shares has constantly lowered your breakeven point. Now with 8,313 shares, the stock only has to go to $\$ 3.65$ a share for you to be even. Figured this way $-\$ 31,000$ now invested, original $\$ 10,000+$ an additional $\$ 21,000$ in cash. So $\$ 31,000$ minus $\$ 590$ in cash $=\$ 30,410$ divided by 8,313 shares now owned, gives you a breakeven point of $\$ 3.65$ a share remember your originally purchased the stock at $\$ 10.37$ a share. Under this system the stock can still drop $65 \%$ in value and you still breakeven. If the stock should go back to its original purchase price, your investment would be worth $\$ 86,837$. It could happen. Maybe not with this stock but when a company stock is very low, the stock could become appealing to somebody.

Maybe some Japanese industrialists wants a way into the American market. Look what Japanese are paying for artwork and Hawaiian real estate (this was in the mid-90s). It's a remote chance that still gives you hope that even if the stock looks like a real dog, it might bark yet. Besides a stock like this will only be a small part, one of 10 stocks, and the other nine will keep you way ahead as you'll see later.

Thanks to the system you're still only down $40 \%$. Your investment is still worth $60 \%$ of your total money invested. Now check the graph for Allis Chalmers at the end of this text in the Adobe Acrobat version and you'll see from the yellow highlighted area how the system is constantly trying to get you ahead. Compare the percentages for each month. The line in black at the bottom represents that month's price as a percent of the original price. The line at the top represents the percent of your investment from the AIM system. This represents column 11, PORTFOLIO VALUE divided by the total amount of money invested.

Thus for March 1987 the stock percent is $\$ 3.12 / \$ 10.37=30 \%$ and the system is $\$ 18$, $338 / \$ 25,000=73 \%$.

Look carefully at the spreadsheet and the graph until you understand. See how much stock you've been buying and at what price and it'll make sense. At times this method of investing seems too good to be true. It is true and you proved that.

And when you look at the colored graph on Allis Chalmers in the Adobe Acrobat version, look towards the middle of the graph and you'll see a three month period when Allis Chalmers almost got to break even thanks to the system whereas the lump-sum investor was way down or at one point AIM got you to $95 \%$ of the value of Allis Chalmers when the lump-sum investor was only at $50 \%$ of his original investment. Just like a drowning man, AIM could let you get out of a really bad stock just due to a slight rally. I would've advised my investors to dump Allis Chalmers when I saw it go back up to around $90 \%-95 \%$. We made a mistake with that stock but AIM gave us a chance to bail out with very little loss.

Again you will find three excellent spreadsheets, two with the actual AIM calculations month by month and then a really neat colored in graph that I drew that really shows the power of the AIM system.

## The Better

The system will help you with all types of stocks. It will not always give you the highest profit on your investment. If a stock always goes up, up, up, then the AIM system will not give you as high a return as if you put all your money into the stock (The lump-sum approach). As many books, articles and magazine show, most lump-sum investors never know when or how to sell. They think the stock will go up forever.

Remember the saddest words and investing are: "paper profits". If you ever hear somebody say: "Why that Amalgamated widgets stock I bought went from $\$ 5$ a share to $\$ 60$ a share. Why I made over $\$ 50,000$ in profits". Ask this lump-sum investor where he stands a year later when Amalgamated widget is selling at $\$ 3$ a share. Usually the lump-sum investor still owns the same number of shares, is in a state of shock, and is bemoaning how could this wonderful stock go down so far but assuring you that it will return to its lofty heights. So what? He still won't make any profits. Try paying your bills, sending your kids to college on paper profits. You need real profits and that is what I'm going to give you.

## Korea Fund - up, up, and away

The Korea Fund is a closed-end and fund that trades like a stock. Since we all know every time we go into a store that half of all the stuff in the store says made in Korea, (well it was true in the mid90s I guess now we would say it's all made in China) we have a vague idea that Korea is doing well economically and they still are. And we are right. As I write this, I'm living and working in Seoul, Korea for the US government. This was in the late 1980s around the time of the Korean Olympics. With their hard work ethic, Koreans have caused a remarkable turnaround in the country destroyed by a war less than 40 years earlier.

Investors have figured out to. The stock has gone from $\$ 14.37$ a share in October 1984 to $\$ 70.37$ a share in July 1987 for an increase of $489 \%$. Now look at the graph of the Korea Fund a page or so ahead in the free Adobe Acrobat version. As you can see, the stock lay dormant from November 1984 to November 1985. Remember that nobody will tap you on the shoulder and give you guaranteed winners. Starting in December 1985, the Korea Fund took off and it has yet to stop as of July 1987.

Now looking at the graph, you can see that the system didn't make you as much profit as the price of the stock gained. The green highlight is the difference between the system's profits and the
percent increase in the stock price. That's because the system was selling shares and giving you real profits, take the vacation profits, do any darn thing you want profits.

Now look at the blue highlights and you see the system profits (amount over your initial \$10,000 investment). The system hasn't done too badly. Your initial $\$ 10,000$ is now worth $\$ 29,288$ or a $192 \%$ increase. You have made good profits in less than three years and still have the potential for more profits. Unlike the lump-sum investor, you have steadily reduced the number of shares you own. Your shares owned have declined from 464 shares to 201 shares. You've taken your profits in cold cash. You've won this round. A downturn won't hurt you as much. I can tell you that by 1993, the Korea Fund did have a downturn into the $\$ 15$ range. Again study the graph in the spreadsheet in your Adobe Acrobat free book. Understand how they work and why they work and then they can work for you. Learning this system will beat the financial odds provide the money to live your future the way you want to. Work for yourself and you'll always have a good boss.

Also I put in the added profit feature I told you about earlier. I readjusted cash to the $2 / 3$ stock $1 / 3$ cache ratio I showed you in Chapter 2. I recommend you do it at least once a year. I took the extra cash and bought more shares - 140 more shares in September 1986. After the first year in September 1985 there was no excess cash to buy more shares with.

## The Best

Why do I call this the best? As you can see from the graph and the spreadsheet again in the Adobe Acrobat version, Dome did not make you as much profit as the Korea Fund although it certainly did much better than Allis Chalmers. Why the best? Because Dome is much more like a typical stock; going up and down and the type of stock that thrives on the AIM system. These are the type of stocks I'm going to show you how to pick. As you can see from the graph, Dome spent much time at less than the original price. That's good under the system because while the stock is taking a nosedive, you're buying all sorts of cheap shares that the system will let you sell later at a much higher price.

Check the spreadsheet and you'll see that you were buying heavily in April, May, June, July, and August 1986 when the price took a dive from your original purchase price. You're loading up for the takeoff when all the shares head back up. And with most stocks they will. Most stocks will show highs and lows of at least $50 \%$ difference every year. Stocks that are volatile (have a high beta) work best in the system. All your buying pays off starting around November 1986 as Dome's share price heads up.

Again as the yellow highlighted areas shows, again in the Adobe Acrobat version, the system keeps you ahead of the share price. Your total investment value is higher. As with Allis Chalmers, the bottom line percent's represent the percent of your original share price, $\$ 10.12$. The line on top represents the percent of your original investment under the system.

The bottom line is that in less than three years, your stock price has risen from $\$ 10.12$ to $\$ 16$ a share or about $58 \%$ higher. But under the system you're $\$ 13,000$ (original $\$ 10,000+$ additional $\$ 3000$ ) is now worth $\$ 23,675$ as of August 1987. Your investment is up $82 \%$ or $141 \%$ of what the stock went up. The system has increased your original investment over $27 \%$ a year for three years. Our AIM system worked to perfection. Your original $\$ 3,334$ of CASH required an additional $\$ 3,000$ from other stocks. Now in August 1987, your CASH account is up to $\$ 11,323$. That's another nice feature about the system; you'll find that some of your investment is in CASH not stock, how much more conservative can you get? You can and reinvest that extra CASH over $1 / 3$ in more stock and continue the profits. Again look at the spreadsheets and graphs you will find in the Adobe Acrobat book.

## Chapter 8

## How to Select the Right Investments

This is an important chapter. It will tell you two important ideas, what stocks, to buy and what stocks not to buy. Later on in additional chapters I added after I wrote this, I will explain how to choose ETF's and LEAPs. What not to buy is easier to tell you then what to buy is. What not to buy usually includes preferred stocks, stocks with large dividends, stock at high share prices, and stocks with small high - low yearly price differences. It is easier to give examples and show what I mean. I'm looking at the January 11, 1988 Barron's stock table for the New York Stock Exchange. Right in the beginning, I find a preferred stock (they're very easy to identify because next to the name of the stock, you'll see "PF". Also, you'll see the annual dividend amount the stock pays. Common stocks will be blank in Adobe Acrobat version. Preferred stocks have a fixed dividend and are primarily for investors who want income. I'll copy the whole line for a couple of preferred stocks and show you why they usually aren't good candidates for the system.

For subscription information to Barron's just go to their website http://www.barrons.com and you'll find you will get a free online subscription when you order a paper subscription.

$124$

| 52 Week |  | Name \& | Sales | Yield | Weeks | Weeks | Weeks | Net Chg. |
| :--- | :--- | :--- | :--- | :---: | :---: | :---: | :--- | :--- |
| High | Low | Dividend | 100 s | $\%$ | Last | Low | Final |  |
| 27.50 | 24.87 | AMR pf 2.67 | 3 | 10.6 | 25.12 | 25.12 | 25.12 | - |
| 11.87 | 4.62 | Adobe | 1709 | - | 6.87 | 5.37 | 6.37 | +1.12 |
| 20.50 | 16.25 | Adobe pf 1.84 | 210 | 10.7 | 17.25 | 16.87 | 17.25 | +.25 |
| 21.00 | 17.50 | Adobe pf 2.40 | 20 | 11.9 | 20.75 | 20.12 | 20.25 | - |

Figure 8-1

I don't know what a subscription costs now but I have one so I should know that but whatever it is it's well worth the cost because you get lots of good ideas on potential stocks that might work well with the AIM system. Again the spreadsheet with the information will be found in the Adobe Acrobat version.

As you can see, preferred's list a guaranteed dividend (they get paid before any dividends are paid on the common stock). Also they list the yield amount which is merely what percent the dividend is of the share price. If the stock is $\$ 20$ and the dividend is $\$ 2$, then the stock yields $10 \%$. When you look at the key component for the system, which is the percent difference for the 52 -week high and low prices, you will see that usually, preferred stocks fail miserably. Let's look at the Adobe trio of stocks and you can see the difference between good and bad 52 - week high and low percents.

| Adobe pf. 184 | $\$ 20.50$ | (52-week high) $=$ | $26 \%$ <br> diff |
| :--- | :--- | :--- | :--- |
|  | $\$ 16.25$ | (52-week low) |  |

| Adobe pf. 2.40 | $\$ 21.00$ | (52-week high) $=$ | $20 \%$ diff |
| :--- | :--- | :--- | :--- |
|  | $\$ 17.50$ | (52-week low) |  |

Now compare this with Adobe common stock with no dividend. This is the stock we used to originally explain the system in chapter 2 (changed stock to Claire's Stores). One factor I recommend is to look for a stock that pays no dividend or a very small one. We want companies that reinvest their earnings (profits) back into the company and not pay them out to stockholders.

You'll see why when you read the chapter on semi-aggressive investing and see that you average a $29 \%$ return a year (first three years) on stocks that pay no or small dividends. Wouldn't you like to make $29 \%$ return than a steady $5-10 \%$ from a preferred stock? Look at Adobe's common stock high and low for the year:

| Adobe $\$ 11.87$ | $(52$-week high $)=$ | $157 \%$ diff |
| :--- | :--- | :--- | :--- |
| Adobe $\$ 4.62$ | $(52$-week low) $=$ |  |

That's a little better. The stock would get further consideration. For now though were only looking for reasons not to buy.

Learning what to buy and not buy is going to take time and a little effort on your part. It's really not very difficult and I believe you'll find it fun and interesting. Again I highly recommend that you get a subscription to Barron's. Buy a copy at your favorite newsstand and decide for yourself. You'll find many articles by stock pickers that talk about exactly the type of stocks we are interested in. Within a short time you'll see how your knowledge and skills of picking out the type of stocks, ETFs, LEAPs you like will grow.

Remember it's not a case of there being only one stock that you have to find to make the system work. There are many, many stocks, ETFs, LEAPs that will work. Nobody can always pick all the best ones; the more you study, learn, and do, the better you'll get. You'll only get better by actually doing. I offer a monthly printed e-mail newsletter with my picks of stocks, ETF's, LEAPs that work well with AIM. And remember you get a free one-year subscription to my newsletter when you buy my e-book. Let me show you how I picked the stocks in my portfolio. It will give you an idea of what to look for in stock.

The first stock I picked was Alaska Airlines. The way I picked it will give you a good idea on how to get started picking stocks. I got a copy of the Wall Street Journal and looked at the New York Stock Exchange listings that included the 52 -week high and low prices. I highlighted all stocks that were lowpriced (currently less than $\$ 15$ a share) and had $52-$ week high/low differences of $100 \%$ or more.

To the local library I took my highlighted stocks and looked up all the highlighted stocks in Standard \& Poor's Reports. How much easier you have it today when with most online brokers you can get free Standard \& Poor's Reports that will always be current and accurate. Standard \& Poor's Reports cover virtually any good stock on the New York, American and NASDAQ stock markets. The big three should be the only stock markets that you look at for buy candidates - don't go to any these flimsy weird little exchanges that might be trying to con you with some penny stock. I then read all the reports on the stocks I picked and tried to pick the best one.

Now like I said earlier, I didn't agonize over it. I like Alaska Airlines for several reasons. First of all the system wants to own the stock for a year or two and then sell out at or near the high for the year. Alaska Airlines immediate future looks good. Alaska Airlines was the leading airline between Alaska and the lower 48 states. We all know about the oil exploration and other commercialization of Alaska. It's only going to get bigger and bigger. Also the population of Alaska was growing faster than any other state.

The stock was paying a small dividend of $1.2 \%$. I liked the increases in revenues I saw in Standard \& Poor's that shows the last 10 years of revenues for stock. Another plus was the fact that $44 \%$ of the stock is owned by institutions (pension funds, mutual funds etc.). Institutions tend to move together (look at the stock market crash of October 1987.) They all sell or buy about the same time based on short-term reason; drop in the last quarter earnings, price of gas goes up, trade deficit, interest rates go higher. These big price swings caused by institutions will help give us the big 52-week high and low differences we want. I bought Alaska Airlines in August 1986. At the time the high for the prior year had been $\$ 26.12$ and the low was $\$ 14.25$. Alaska Airlines was then selling at $\$ 16$ a share.

It's very different actually putting your money where your mouth is. I went with a fairly conservative first stock because I didn't want to get burned right out of the gate. Nothing wrong with that. Alaska Airlines was also more per-share than I would have liked. I felt it was a good stock, with a good future and have no regrets. I made money on the first year and feel that would continue to pay off - (update - it has!)

Also, in August 1986 I bought Compaq Computer. I was already familiar with Compaq. Right after I had finished my original research on stocks up but before I learned about the system, and was itching to buy, I came into some money (won $\$ 750$ at a craps table in Atlantic City).

I came back to Frederick, Maryland and looked for a stock to buy. I chose Compaq for several reasons. First I thought computers were going to be a tremendous growth industry. But IBM, the leader didn't appeal to me. The stock was priced too high and didn't have the high/low yearly swings I like. I felt much better taking a chance on a new company in a growing field and felt I could make more money before everybody discovered Compaq. Wouldn't you like to buy McDonald's when there were only a few stores out there?

I went to the local broker. I picked a Merrill Lynch office I found in Frederick. They get excited when you walk in off the street to open an account. So I opened my account and bought 100 shares of Compaq at $\$ 6.75$ a share. At this time I knew nothing about the AIM system but another book I had read, The Hidden Stock Market, How to Pick \$5 Dollar Stocks that Can Double in 6 -12 Months, made an impression on me.

I was buying a stock I felt would double in 6 - 12 months. Well I bought this stock in August 1984 and naturally started to follow it closely. By October or so, the stock had sunk to $\$ 3$ dollars a share. I had no money, naturally, and I just knew the stock would zoom upward. Within a couple of months, the stock was up to $\$ 10$ a share. I knew then I wanted a way to profit from stock fluctuations. When he finally found one, I remembered good old Compaq.

By the time I got around to the system in August 1986, Compaq, bigger and better than ever was now listed on the New York Stock Exchange (used to be a NASDAQ stock). I read some very positive things on Compaq in Barron's and found many things to like about the company. The young dynamic management, the quality of their computers, and the tremendous acceptance of their products impressed me. A quick glance at just one financial statistic will prove that just look at the revenue since complex birth:

| 1982 | Not measureable (birth) |
| :--- | :--- |
| 1983 | $\$ 111$ million |
| 1984 | $\$ 329$ million |
| 1985 | $\$ 504$ million |

| 1986 | $\$ 625$ million |
| :--- | :--- |

Also impressive was the fact that management held $10 \%$ of the stock. Also, Compaq had good high low differences:

|  | 1986 | 1985 | 1984 | 1983 | 1982 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| High | $\$ 21.62$ | $\$ 14.25$ | $\$ 14.62$ | $\$ 12.37$ | NA |
| Low | $\$ 11.62$ | $\$ 6.12$ | $\$ 3.50$ | $\$ 10.87$ |  |

As you read from 1987 when I owned the stock, it did even better. Believe me once you start learning about investing, good stocks will appear to you also. The best thing to do is read investment publications such as Money Magazine and Barron's and others that give out investment information (of course I wrote this before I ever started my monthly newsletter which again should be one of your favorite spots to find good stocks for the AIM system.) If you see a stock that looks appealing, get the Standard \& Poor's Report and start checking it out.

That's what I did when I bought Claire's Stores. Here's just how simple my selection was. I was reading the August 3, 1987 issue of Barron's and came across a typical type of article that Barron's has frequently, an interview with a stock analyst to talk about several stocks he liked. This article was titled Cherry Picking in Florida, in which Richard Lilly trains his sights on companies in the Sunshine State.

Mr. Lilly mentioned several Florida companies he liked. His quotation on Claire's Stores was, 'back on track is one of the highest profit margin and fastest-growing specialty retailers. $70 \%$ + gross margins". Well, that got my attention. Mr. Lilly also said he had been a long-term bull on Claire's which operates boutiques selling costume jewelry, handbags, and other items. He said he recommended it when it was selling around $\$ 2$ a share in the early 80s and it climbed to $\$ 20$ a share in 1985. Then it sank again as low as $\$ 6.25$ and currently (August 1987) was selling at $\$ 9.50-\$ 10$ a share.

Mr. Lilly felt most of Claire's problems were behind them, that the number of stores was growing, an upscale subsidiary was off to a good start, and that management was getting better. He felt Claire's best days were ahead. Well I filed this information away, literally. Anytime you see an article like this in Barron's, you should clip them out and save them for future reference. Well I finally had enough money to buy another stock in December 1987 and I thought of Claire's Stores. I already owned three stocks

- Alaska Airlines, Compaq Computer, and Golden Nugget (next).

All three of these I regarded as conservative as all three were over $\$ 10$ share when I first bought them. This time I truly wanted an under $\$ 5$ stock. I wanted to own at least 100 shares of something. Moreover, I felt that percentagewise, a low stock under $\$ 5$ has the best chance for large profits.

So I did exactly what I told you to do - I checked out Claire's Stores in the Standard \& Poor's Report. I was excited to check it out because I had already looked up Claire's Stores in the newspaper. Thanks largely to the great October 1987 crash, Claire's was selling near its 52-week low. A check of Barron's in early December 1987 showed Claire's Stores was selling at $\$ 3.50$ a share, the 52 -week low was $\$ 3$ and the 52 -week high was $\$ 13$ - just the high/low ratio range I like. A review of the Standard \& Poor's showed additional things to like.

|  | 1986 | 1985 | 1984 |
| :---: | :---: | :---: | :---: |
| High | $\$ 11.62$ | $\$ 19.75$ | $\$ 9.12$ |
| Low | $\$ 6.25$ | $\$ 850$ | $\$ 250$ |

Claire's showed good high/low ranges for the last several years. This isn't mandatory but I regard it as a good sign. See the summary sheet of Claire's Stores in the Adobe Acrobat version of the free book you will be receiving

Also I liked what I read about the company; the number of stores had grown from 155 in 1981 to 439 stores in 1987. Revenues had grown from $\$ 36$ million to $\$ 74.5$ million in 1986. Also, Claire's had no long-term debt and expected to finance store growth from internally generated funds. Also one family controls $26 \%$ of the stock and institutions hold about $25 \%$. Net income had doubled in the past couple of years. All this was enough to get me to take a chance. Claire's paid a very small dividend, not enough to matter. I like the price range I found. I felt much of the reason for the low price was outside factors like the stock market crash or general dislike for retail stocks. All this will let us buy low and sell high.

In September 1987 I bought Golden Nugget stock. I lived in Las Vegas for four years and visited it many other times. Millions of other people like to gamble and I feel the gaming industry will always do well. People love to gamble and there aren't that many convenient places (written years ago, that's changing) they can gamble. The management of the Golden Nugget and the hotel/casino itself impresses me. It is one of the finest places you'll ever see.

What got me excited to buy Golden Nugget was the fact that they were building a brand new casino with over 3,000 rooms next to Caesar's Palace. Their current revenues showed a drop because they sold their Atlantic City operations. The new hotel/casino will open sometime in 1991. So I "gambling" on the success of the new hotel/casino. I think it's a good bet. The stock shows good but not great high/low swings:

|  | 1986 | 1985 | 1984 |
| :---: | :---: | :---: | :---: |
| High | 16.87 | 13.50 | 15.37 |
| Low | 9.12 | 9.25 | 8.12 |

I just felt comfortable with this stock and know that I can visit my investment and stay in my investment anytime I'm in Las Vegas. It's my faith in Steven Wynn and the rest of management that caused me to buy the stock. I have great faith that the new hotel/casino will be very successful. I'm willing to bet on the future of the Golden Nugget.
You should always buy stocks that you ultimately feel will be successful. They will always have ups and downs (very profitable ups and downs) but you want them to be rising to higher plateaus of highs and lows. Look at Alaska Airlines - how it shows this - in 1980 the high was 5 and the low was 3; in 1982 the high was 14.37 and the low was 4.62 ; in 1984 the high was 17.25 and the low was 9.25 , and in 1986 the high was 22.75 and the low 14.25 . No stock will ever be perfect but look for steady upward progress. It's easy to tell by checking the Standard \& Poor's Stock Reports; which shows the high and low prices for the last ten years if the company has been traded that long.

I've given you a chance to crawl around in my brain for the stocks I have bought. I found many others that I like but don't have the money yet to buy. If you like and buy my book, then I will be buying a lot more. I'm now going to give you some other stocks I like (circa 1987 or so) and a brief explanation of why I like them. These stocks may no longer be good buys at the time you read this years later. However, the principles and reasons for liking the stock are timeless and there will always be current stocks to like for the same type of reasons.

Born to be Wild? I like Harley-Davidson. They make the unique American product, Harley-Davidson motorcycles, the only American motorcycle. They just recently bought Holiday Rambler, a manufacturerof recreational and commercial vehicles. Harley just shifted from the American to the New York Exchange. Since the stock started trading, price fluctuations have been good.

Another I like is Advanced Micro Devices (listed as AMD on the New York Stock Exchange). Again with all stocks, the basics apply, - good high/low fluctuations, low per share price, and continued good prospects. Also you're always much better off buying the stock at or near its 52 -week low. This is extremely easy to tell by checking the stock in the stock tables of any good financial newspaper.

If you love investing get a good daily financial newspaper like the Wall Street Journal or Daily Investor. But you don't need to. If you are only going to buy one financial newspaper, I recommend Barron's. It has taught me a tremendous amount about stocks and investing. Besides, I find it highly entertaining, honest, funny, informative and very concerned about the small investor. If you get a subscription, you'll still need to buy a daily paper the beginning of the month to find out the current prices so you can do the system.

Meanwhile back at Advanced Micro Devices. I saw AMD recommended by one brokerage house in Barron's. I found AMD was selling was selling near the year's low (high was 33.50, the low was 12.87). Standard \& Poor's had some good comments and predicted a strong rebound and expected earnings increases in 1988. Also felt long term prospects were good based on aggressive research and increased emphasis of proprietary (moneymaker) items. Sounds good to me.

Remember Adobe, the common stock? They got a good review from an oil analyst. I feel oil stocks are a good play in any balanced portfolio. Adobe is low priced (high was 12.62 and the low was 5.25) in 1986. Adobe and the other oil stocks are still depressed and you can get them at a bargain at this time. I'm sure they'll be at bargain prices occasionally in the future too.

I like various other stocks on the three exchanges. And remember I said I like them, I didn't say I'd buy all of them. Look at a stock's current high, low, and actual price when you want to buy. You can gather from most of the graphs and charts in this book that I included stocks I like. A couple of bad ones were included as examples and aren't recommended. I have many others that have piqued my interest but I haven't had the time to make any detailed study on. One area I find especially interesting but haven't had the time to explore is closed-end mutual funds. Check out Barron's and you'll find Morningstar offers a closed-end mutual fund guide.

Remember that buying stocks is a lot like fishing, I can tell you where the big ones are but it's up to you to pick the right time, rod, bait, and method. I'm your guide. Besides the satisfaction and self-esteem will come from patting yourself on the back for doing it yourself. The money made will be nice but you'll have a bigger smile of satisfaction from doing something to benefit yourself, your family and ultimately America itself.

In the last few years I've picked up more ideas on how to pick the best stocks. Again I recommend Bill Mathews' book, Winning Big with Bargain Stocks. He offers many excellent tips on picking the best stocks.

Here is another factor worth looking at. It's the P/E ratio or price earnings ratio. Price earnings ratio is the previous closing price of the stock divided by the latest 12 months per share earnings. Companies only have $\mathrm{P} / \mathrm{E}$ ratios if they are profitable. Check the stock tables in the paper and the $\mathrm{P} / \mathrm{E}$ ratio is listed for profitable companies. A good basic rule is if the $\mathrm{P} / \mathrm{E}$ is under 10 , the stock is a good buy possibility.

If you look at the bottom of the Standard \& Poor's 2-page reports, you'll see the P/E listed below the high/low yearly prices. However just because there isn't any P/E doesn't mean we aren't going to buy. One reason a good company might have low stock prices is that they lost money the previous quarter or year. If you see reasons why the company can reverse that and make a profit the following year, the stock is a good buy.

I also want to talk a little about stocks in bankruptcy and other low priced (under \$2) stocks. These stocks are the riskiest and the most profitable of any in the system. All stocks in bankruptcy (Chapter 11 , under court protection and given time to reorganize) are identified by "VJ" in front of the name "VJCirclek" for example. These stocks should be considered by investors willing to handle more risk. Same basic rules apply - at or near year's low, prospects for company turning things around in following year. Mr. Mathew's book explains these types of stocks very well. With stocks this cheap, you don't need to put up $\$ 1,500$ per stock. $\$ 750, \$ 500$ stock, $\$ 250$ cash would be fine.

Later I explain that you should diversify and have 10 stocks in the system. I strongly think 2 or 3 of these risky stocks belong with 7 or 8 more conservative stocks. I want you to study the monthly price changes and you'll see that in some months prices double or triple. Great volatility. Of course timing is everything. You don't want to buy one of these just before bankruptcy or it could get expensive. Wait till the stock hits a low in bankruptcy. For example look at VJLOMASFNL. (Chart at end of chapter). If you had timed it right and bought in Jan 91 at $\$ .28$, in four months the stock was $\$ 1.12$, not bad. Or look at VJCIRCLEK, you could have bought at $\$ .37$ a share in Jan 91 and it was $\$ 1.25$ a share two months later.

Here are a few good tips for buying Chapter 11 bankruptcy stocks:
1 - Look in Barron's for articles on the company - find a reason you think the company will continue,

2 - Monitor closely \& get ready to sell all shares if total liquidation of the company seems imminent (for example Pan Am was in bankruptcy a long time \& then liquidated. Barron's alerted investors that the company was doomed if financing wasn't found and you had a chance to get out.)

3 - Look for bankrupt companies with large sales and a well-known name. Look for increasing sales and reasons to like the company, like they're selling an unprofitable division, cutting costs. A reverse stock split is usually a bad sign - if you see a 1-4 reverse split about to happen, probably time to get out.

Look at the attached page at the end of this Chapter of low priced and bankrupt stocks and you'll see that great profit possibilities exist. Read Mr. Mathews book, he has good advice on bankrupt stocks.

## NEW YORK STOCK EXCHANGE <br> JAN 1991 - DEC 1991 <br> LOW MONTHLY PRICE <br> VOLUME 100,000 SHARES A WEEK

## Chapter 9

## Conservative Strategy

Different strokes for different folks. Some of you will only feel comfortable with conservative blue-chip type stocks. Nothing wrong with that. I'll show you that the system works fine with blue chips. I took a group of blue chippers and will show you an excellent return for your money. I took six Baby Bells - Ameritech, US West, Bell South, Southwest Bell, Pacific Telesis, plus National Semiconductor, Ford, General Motors, and Chrysler.

I originally charted these 10 stocks for three years ending in September 1987. Over Christmas 1993, I got curious how these trended since 1987. So I charted them through the end of 1993. I've left the spreadsheets for the first three years in the book but didn't want to waste the paper including the other six years. I will update the gain chart so you can see how you did for nine years owning the SAME 10 stocks. I ignored commissions and dividends (should about cancel each other out) and rounded off buys and sells to the nearest whole share.

Here are the results: you started with $\$ 100,000(\$ 10,000$ per stock). Remember you can start with $\$ 1,500$ per stock if that is what you can afford. At the end of the first year, your initial $\$ 100,000$ had grown to $\$ 111,752$ for an annual return of $11.7 \%$. By the end of the second year, your original $\$ 100,000$ had grown to $\$ 141,864$ for a two-year return of $41.8 \%$. You finished at the end of the third year with $\$ 158,998$ for a $58.9 \%$ return for three years. That strikes me as a really good return on a conservative investment. Remember you still have better prospects ahead. I won't keep you in suspense any longer - at the end of nine years your $\$ 100,000$ has grown to $\$ 377,270$ for a compounded annual gain average of $16 \%$. The only negative found was that total cash went negative for a 3 month period as a couple of your stocks had very large buys. Cash still only needed alone of $\$ 5,500$ in the seventh year when your
portfolio was worth over $\$ 223,000$. See chapter

for more information on cash.
You would still have good prospects ahead with the stocks (I would really dump General Motors and find another like Intel or Microsoft). These are the perfect type stocks for the investor who wants good profits and doesn't like picking stocks.

You can always make good money playing conservative stocks. In the following pages in your free Adobe Acrobat book I'll show you year by year profits for all nine years for the 10 stocks and the system spreadsheets for the first three years. You'll see I adjusted the cash/stock ratio once a year and used any extra cash about $1 / 3$ of the portfolio total to buy extra shares.

At the end of the chapter I have only shown one spreadsheet to save space for the conservative stocks - the one shown is for Ameritech for the first three years. If you would like to see the remaining spreadsheets for the conservative strategy, please go to my website http://www.jijiinvesting.com and click on Book by Chapters and go to Chapter 9.

## Chapter 10

## Semi - Aggressive Investing

I'm especially happy with this chapter because these are the type of stocks I pick for myself. Alaska Airlines, Compaq, and Golden Nugget are three stocks I've owned. These types of stocks are little bit from the wrong side of the tracks to blue-chip bluebloods. As such the investing world deems them riskier and thus to my mind increases my profits. As such can see by comparing your yearly profits under semi - aggressive to conservative stocks, your profits were over twice as high $-139 \%$ versus $59 \%$. By taking a slightly bigger risk, you will be greatly rewarded.

This illustrates the system at its best - big profits from dynamic young growing companies. Again study the charts. For the stocks that started later than October 1984, I just used the profits as of September or October 1985 when the other stocks had completed a full year.

Don't let the $\$ 10,000$ per stock discourage you; you could have turned $\$ 15,000$ ( $\$ 1,500$ per stock) into $\$ 38,850$. Always do the best you can with what you got. Not only will the money come in handy someday, but the self-respect and pride in yourself coming from doing something for yourself will yield an inestimable, immeasurable boost to your self-confidence and your life. Remember every day in every way you're getting better and now richer. You made $132 \%$ in three years, more than doubling your money. This illustrates the system at its best. It will do the same for you.

Also you'll notice I do something very different with the 10 stocks here and the 10 in the conservative strategy. I re-adjusted the stock/cash balance back to the $2 / 3$ stock, $1 / 3$ ratio. I did not do this in chapter 2 as I was trying to keep learning the system easy.

I took the excess cash over $1 / 3$ and bought more stock. Again I haven't used the system to the max. I took the money out once a year and bought the same stock regardless of price. I ignored with the stock was at or near its year's low. When you do this for real, here are the best ways to maximize profits:

1 - Look more often for excess cash.
2 - Either buy one of your existing stocks that is at or near its year's low or buy a new stock that is at or near its year's low. Here's an explanation to show you what I did. Look at Alaska Airlines. I readjusted cash and stock in November 1985 (11/85). Here's what I did:

151

I looked at 10/85 and found the following:

| SHARE VALUE | CASH | PORTFOLIO VALUE |
| :---: | :---: | :---: |
| $\$ 6,306$ | $\$ 8,918$ | $\$ 15,224$ |

I multiplied $\$ 15$, 224 X $.33=\$ 5,024$. Thus $\$ 5,024$ is $1 / 3$ of my PORTFOLIO VALUE. So I subtracted the cash balance:

| $\$ 8,918$ |
| :---: |
| $-\frac{\$ 5,024}{}$ |
| $=\$ 3,894$ of excess cash |

I took the $\$ 3,894$ of excess cash and bought an additional 193 shares of stock - $\$ 3,894$ divided by $\$ 20.12=193$ shares. Then I put "+ 193 shares" in the shares bought column in November 1985 $(295+193=488$ shares owned). Also, I added 3,894 to PORTFOLIO CONTROL. Remember when you first buy stock or buy additional shares with excess CASH, you increase PORTFOLIO CONTROL by $100 \%$ of the amount bought. Again it's simple and will become second nature with a little practice. I omitted the rest of the spreadsheets from Chapter 10. If you would like to see all the spreadsheets, please go to: http://www.jijinvesting.com, then click on Book by Chapters,

## Chapter 10.

The three spreadsheets used in Chapter 10 will be found in your free Adobe Acrobat version.

| SHARE VALUE | CASH | PORTFOLIO VALUE |
| :---: | :---: | :---: |
| $\$ 6,306$ | $\$ 8,918$ | $\$ 15,224$ |

I multiplied $\$ 15$, $224 \mathrm{X} .33=\$ 5,024$. Thus $\$ 5,024$ is $1 / 3$ of my PORTFOLIO VALUE. So I subtracted the cash balance:

| $\$ 8,918$ |
| :---: |
| $-\underline{\$ 5,024}$ |
| $=\$ 3,894$ of excess cash |

I took the $\$ 3,894$ of excess cash and bought an additional 193 shares of stock - $\$ 3,894$ divided by $\$ 20.12=193$ shares. Then I put "+ 193 shares" in the shares bought column in November 1985 $(295+193=488$ shares owned). Also, I added 3,894 to PORTFOLIO CONTROL. Remember when you first buy stock or buy additional shares with excess CASH, you increase PORTFOLIO CONTROL by $100 \%$ of the amount bought. Again it's simple and will become second nature with a little practice. I omitted the rest of the spreadsheets from Chapter 10. ## Chapter 11

## Cash Combined in One Account

When you open your stockbroker account, you'll probably start with more than one stock and hopefully 10 stocks - the ideal number. When you start the AIM system, you'll have a separate spreadsheet for each stock and a separate cash account for each stock on the spreadsheet.

However, you really have ONE Money Market Account with one balance. You started with 10 stocks and $\$ 15,000$; then you would have one money market account with your broker with a balance of $\$ 5,000$ assuming all 10 investments use the ratio of $2 / 3$ stocks and $1 / 3$ cash ratio.

Now look at the spreadsheet showing the 10 cash balances in the cash total in Chapter 11 of your free Adobe Acrobat book. Now you see what I was talking about in Chapter 2, when you had to "borrow" money to buy more Adobe. You will really be borrowing from the other stocks in your money market account.

I recommend you set up a summary cash sheet like this for yourself. You could also put in a column showing PORTFOLIO VALUE. Then you could quickly decide when you're cash balance exceeds $33 \%$ and use the extra money to buy additional stock.

The cash balances will not be the same as the cash figures in the Chapter 15 spreadsheets. The balances shown here reflect the net cash amount remaining. For example, if the cash balance on the spreadsheet was $\$ 5,000$ but the stock "borrowed" $\$ 4,000$ than the cash summary which show $\$ 1,000$. If the stock didn't borrow cash then the numbers of the same. Here I'm trying to show the actual cash remaining in your money market account with your broker.

## Chapter 12

## Why the AIM System Works

A check of the share price of Campbell Resources (spreadsheet next page in your Adobe Acrobat book) shows it has declined from the original price of $\$ 6.00$ a share to $\$ 2.37$ a share or a $61 \%$ drop. Thus a lump sum investor (all money is in the stock), if he or she had invested the same total amount of money you had (in total $\$ 35,000$ ), would've lost $61 \%$ and the $\$ 35,000$ investment would have lost $\$ 21,350$ and be worth $\$ 13,650$ in November 1987. Compare that to what your investment is now worth. Your portfolio is worth $\$ 48,610$; quite good for stock that may be a total disaster. You're ahead $\$ 13,610$ or $38.8 \%$. How do we do it? What's the trick? Why does the system work?

I was curious myself and so I started investigating. A review of the buy/sell chart at the end of the chapter shows that your average buy price (excluding initial buy) was $\$ 1.35$. Your average sale price was $\$ 1.95$. Thus you made $\$ .60$ per share profit on every share you sold.

You sold 13,000 X \$. $60=\$ 7,856$
Some profit comes from interest earned on the cash balance (add column 10) $=\$ 1,120$. The rest of the profit comes from the increase in value of your remaining shares. I won't give all the details but will show you a couple of examples: you buy 5,771 shares at $\$ .94$ each and 5,291 shares at $\$ .87$ each. As of September 1987, the share price for Campbell Resources is $\$ 2.37$. Each of the 5,771 shares is worth $\$ 1.43$ more than what you paid for it or $5,771 \mathrm{X} \$ 1.43=\$ 8,252$ more. Each of the 5,291 shares is worth $\$ 1.50$ more than you paid for it or $5,291 \mathrm{X} \$ 1.50=\$ 7,937$ more. If you check the buy sheet, you'll see other months where you bought stock for less than the current $\$ 2.37$ share price.

When you see that you can make money on a stock that drops $61 \%$ below your original purchase price, you know you have a really amazing system. Of course you had to have a fairly tough attitude to hang in there and put that extra $\$ 25,000$ into the stock. Think of the profits if Campbell Resources merely goes back to its original selling price. Or if you decide to get out, sellout; you can sell all your shares, take your profit and get into another stock. The choice is yours. See Campbell Resources spreadsheet in your Adobe Acrobat book.

## Chapter 13

## Miscellaneous Ways to Check on Stocks

Here's the first in checking on any stock should like. Start saving the first issue each month of Barron's. Wow, have times changed since I wrote this in the late 80s. You don't need to do hardly anything with paper anymore. You can easily look up the historical prices for any investment at Yahoo Finance. All you do is type in the symbol for the stock or ETF that you wanna look up. Then you will get the summary page showing the basic information on that stock or ETF. Just look in the left-hand column and you'll see a hot link that says historical prices. Click on that and then you can review any time you want by day, week, or month or just look up dividend payments; it's a really useful tool that I highly recommend.

When you find a stock you like, look it up in Yahoo and look at the closing price for the stock or ETF. I think you can even print it out if you want to. I also offer a monthly newsletter. And all buyers of my e-book will get a free one-year subscription to my monthly newsletter that has price and other important information on stocks I recommend to help you. Then if you want, make a spreadsheet on the stock and charted to see how it would have done under the system for the last 12 months or so. Of course you should pick as your starting month, a month with a price was at or near the 52 week low, this is the cardinal rule for picking stocks in the system. As you get more experience, you'll be able to just glance at monthly prices and see if the stock is the kind of fluctuations that work best. In the example shown, Barron's had an article on oil stocks, so I jotted down all the oil stocks they mentioned and checked back on the prices to find the best ones for the system.

As a personal note, on the other page in this chapter, I jotted down my ideas for this book one night at Camp Humphreys, Korea at a local Korean hotel while on TDY that was near the DMZ; those ideas led to this book. Never ignore an idea. They can lead you to a whole new life.

## Chapters for book

Chapter - showing groups of tens
Chapter - warrants
Chapter - my actual purchases
Chapter - why system works - (highlight buy prices and sell prices)
(graph showing percent decline from stock price vs. past value)
Chapter - what types of stocks to buy and not buy for system
Chapter - 10 stock type portfolios - samples, warrants, stock, goal funds etc.
Chapter - on Merrill Lynch Blueprint - get more info, use examples they sent me
Chapter - groups - oils, gambling etc.
Chapter - how to use system (list cash combined in one account, stocks listed separately)
Chapter - aggressive strategy, moderate and conservative
Chapter - philosophy of success (use old book board at Bookman's)
(list of good books - stock and non-stock)

Chapter - how to handle spreadsheets for taxes - FIFO etc.
Chapter - stocks to avoid (warrants) and stocks to pursue
Chapter - how to do it yourself - pick stocks, good ones, bad ones
Chapter - seven rules for investing success (newspaper)
Chapter - experimenting with system

## Chapter 14 How to Handle Taxes from Your Profits

The new tax law makes the short-term buying and selling happening under the system, the same taxwise as long-term trading. No longer is there a tax break on long-term capital gains - this was true when I wrote this in the 80 s ; you'd have to check on the current status of how short-term capital gains on long-term capital gains are taxed as probably a change again this year as Congress wrestles with the debt problem.

The spreadsheets that you are keeping on all your stocks will also help you to figure your basis (cost of the stock) that you will need to figure out the amount of taxes on your profits. There are several ways to figure basis, all high falooting accounting terms like LIFO and FIFO. LIFO stands for Last In First Out. FIFO stands for First In First Out, I recommend FIFO. It will work out to be simpler. In the system you are going to be buying $\$ 5$ shares of stock that will be sold as $\$ 10$ shares of stock to greatly simplify the examples in this Chapter.

I'll give a simple example of how this works:

| You Buy | 100 shares at $\$ 10$ a share | January 1 |
| :--- | :--- | :--- |
| You Buy | 100 shares at $\$ 5$ a share | February 1 |
| You Buy | 100 shares at $\$ 4$ a share | March 1 |
| You Sell | 125 shares at $\$ 15$ a share | April 1 |
| You Sell | 100 shares at $\$ 20$ a share | May 1 |

This is hypothetical but greatly hoped for.
How would you figure taxes? I'll include commissions, phone calls and other deductible costs. Under FIFO, you use the cost of the stock you first bought (the oldest shares of the same stock you're selling). So the cost (basis) of the first 125 shares in the example above would be:

| 100 shares $\mathrm{X} \$ 10=$ | $\$ 1,000$ (acquired Jan. 1) |
| :--- | :--- |
| $\underline{25}$ shares $\mathrm{X} \$ 5=$ | $\$ 125$ (acquired Feb. 1) |
| 125 shares | $\$ 1,125$ (your basis 125 shares) |

The $\$ 1,125$ is only part of your cost. Let's say you paid $\$ 100$ in commissions to buy the stock, had $\$ 20$ in phone calls, and bought $\$ 10$ in research reports. Here's your total basis:

| Stock | $\$ 1,125$ |
| :--- | :--- |
| Commissions + | $\$ 100$ |
| Phone Calls + | $\$ 20$ |
| Research Reports + | $\underline{\$ 10}$ |
| $=$ Total Cost | $\$ 1,275$ |

Now how much profit did you get? You sold 125 shares at $\$ 15$ each for a total of $\$ 1,875$. But did you actually get $\$ 1,875$ ? Let's say you paid $\$ 100$ in commissions to sell the stock, had a $\$ 10$ phone call, and bought one research report for $\$ 10$. Here's your total profit:

| Stock | $\$ 1,875$ |
| :--- | :--- |
| Commissions - | $\$ 100$ |
| Phone Call- - | $\$ 10$ |
| Research Report - | $\underline{\$ 10}$ |
| $=$ Actual Proceeds | $\$ 1,755$ |

Thus actual profit was $\$ 1,755-\$ 1,275=\$ 480$.

Next month you sell 100 shares. Your cost for these 100 shares would be:

| 75 shares | $\mathrm{X} \$ 5=$ | $\$ 375$ (remaining 75 shares bought Feb 1$)$ |
| :--- | :--- | :--- |
| 25 shares | $\mathrm{X} \$ 4=$ | $\$ 100(25$ of the shares bought Mar. 1) |

Thus basis is $\$ 475$ plus any commissions, phone calls, research reports directly related to this stock. Your actual proceeds are 100 shares $\mathrm{X} \$ 20=\$ 2,000$ minus commissions, phone call, and any other directly related costs. The government subsidizes some of your costs.

This is one reason you need to save all the statements that your broker sends you every time you buy or sell. Again in the high-tech world of today this is very easy because you can easily look up all of your buy and sell prices right on the broker's website.

On your scheduled D Capital Gains and Losses Form (see at end of chapter in the printed version), again you will find the Schedule D in your free Adobe Acrobat investing book. All you have to put on the form are the dates you bought and sold and the actual proceeds from the sale and the total cost. Then subtract the cost from the proceeds and the difference write in the proper place. Basis goes in column E and sales proceeds go in column D. Then add all your profits and subtract any losses (if you lost money from another investment).

You can take up to $\$ 3,000$ and losses in one year. If you had more than $\$ 3,000$ in losses, you have to carry it forward and use it in the following year. All your short-term capital gains are taxed at your rates for adjusted gross income. Long-term capital rates change often so consult the current year's tax form. In reality for small investors, any differences between short and long-term would be so slight it is more worth worrying about. After you summarize your profits, the total amount goes on your 1040 on line 14 of the return - summary of Schedule D.

I don't claim to be a tax expert so if you have any questions in your mind see an expert. This will be your year-end look at how you did with the system. The bottom line is profits and you will see them and they will grow year-to-year. Good luck and may you be free from the chains of having to work at something you don't want to as soon as possible.

I've enclosed a copy of my 1987 schedule D that shows how I figured my taxes on my stocks. My basis was my cost per share from the original purchase on $7 / 25 / 86$. It's easy to figure: all I had to do to figure the sale price was to subtract the commissions' Blueprint charged. The forms Merrill Lynch

Blueprint sends the gross (before charges) and net sales price (money you get). You report the net sales price. You only pay taxes on your actual profits.

## Chapter 15 The System for Large Investors

It's time to take the system and see it in the real world. I'm going to show you how commissions affect the system and show you real world judgments used to improve profits. We're always trying to maximize profits and you'll find that a few simple decisions will greatly increase profits. This chapter is for larger investors ( $\$ 10,000$ per stock) and will show large investors a gain of $568 \%$ after commissions for seven years. Your portfolio rose from $\$ 101,200$ to $\$ 676,023$, an average gain of $80 \%$ a year.

At the end of four years I evaluated the portfolio - remember I told you you're not married to your stocks. I had held all 10 stocks for four years. I only evaluated the stocks I owned once in four years for three reasons:

1) by doing it once I could keep the example as simple as possible
2) when I first wrote the book I didn't think to do it
3) by doing it once you see the dramatic effect - an increase of $76 \%$ in the fifth year versus only $16 \%$ the year before

In real life I recommend you evaluate your portfolio at least once a year. The best time to sell all remaining shares is when they are at or near the 52 -week high for the year. This is the opposite criteria of what we want when we want to make our initial buy. Of course when we sell all our remaining shares, we immediately put all the proceeds into a new stock that meets our requirements.

Look in the next chapter for the reasons I sold the five stocks and the reasons I bought new stocks. Also look in the next chapter for how to buy and sell so you buy and sell $100 \%$ of what the system tells you. The two chapters are almost identical except for the amount of money invested. Another thing we did to boost profits was to buy additional shares. After one year the CASH amount had grown larger than $1 / 3$ of the PORTFOLIO TOTAL. We took this extra cash and bought additional shares of the same stock. Remember we make our profits buying and selling stocks, not collecting interest on large cash balances. Below is an example of what we did in the first year (same thing done every year):

| STOCK | 1 <br> PT <br> PORT. VALUE | $1 / 3$ PT <br> CASAR TOTAL | VALUE <br> PORT. | EXTRA CASH |
| :--- | :--- | :--- | :--- | :--- |
| Alaska Air | $\$ 15,018$ | $\$ 8,712$ | $\$ 5,006$ | $\$ 3,706$ |
| Compaq | $\$ 16,126$ | $\$ 10,004$ | $\$ 5,321$ | $\$ 4,623$ |
| Superior Ind. | $\$ 11,999$ | $\$ 5,842$ | $\$ 4,000$ | $\$ 1,842$ |
| Golden Nugget | $\$ 11,391$ | $\$ 5,082$ | $\$ 3,778$ | $\$ 1,304$ |
| Bush Ind. | $\$ 7,895$ | $\$ 1,547$ | $\$ 2,629$ | 0 |

Checking for extra cash is also something you should do at least every year. When you find some, buy more stock and remember to increase PORTFOLIO CONTROL by $100 \%$ of the amount of additional stock bought.

For the 5 stocks that I took the cash over $1 / 3$ of PORTFOLIO TOTAL to buy additional shares, I made the discovery why PORTFOLIO CONTROL should be increased $100 \%$ of the amount used to buy additional shares. This is because if you only increase PORTFOLIO CONTROL by $50 \%$, you get an immediate sell at the same price you paid for the new shares. This defeats additional gains from the purchases of new shares.

Remember the only times you increase PORTFOLIO CONTROL $100 \%$ of the buy amount are:

1)     - when you initially buy stock;
2)     - when you take cash over $1 / 3$ of PORTFOLIO VALUE and buy additional shares;
3)     - when you add extra money to an existing stock.

All other buys increase PORTFOLIO CONTROL by $50 \%$. Read this chapter and the next chapter carefully and really understand the reasons for doing what they say. All reasons are based on the incredibly simple premise of doing things to make the highest profits with the least risk. You can read why we sold the five stocks in the next chapter.

Selling the five stocks gained us $\$ 86,433$ (I subtracted $\$ 9,144$ from the fourth-year total of $\$ 95,577$ because our cash was minus $\$ 9,144$ at the end of the fourth year) which we used to buy five new stocks in the fifth year. Thus each of the five stocks started life with $\$ 17,287$. We kept the stocks for the next three years (years 5-6-7). After the fifth year we sold our remaining original five stocks because they had matured, were a little high-priced, and we had been doing our homework and found five new stocks we wanted to own. Our last five stocks started with $\$ 38,744$ each.

Our portfolio grew from $\$ 101,200$ to $\$ 676,023$, a $576 \%$ increase or a compound growth rate of $30 \%$ the year for seven years. A reviewer of our CASH account will show ups and downs. I omitted the first three years of the CASH account because the total wasn't negative. For the next three years, your CASH portfolio only showed a negative balance in four months. In the seventh year your CASH account went negative for three months, hitting a low of - $\$ 24,424$, however, look at your PORTFOLIO VALUE - at the end of the sixth year, your portfolio was worth $\$ 328,350$ and at the end of the seventh year $\$ 676,023$, a gain of over $\$ 347,000$. I figure after doing the system for six years and being ahead over $\$ 200,000$, you could come up with an extra $\$ 25,000$ - it was worth it. At the end of the seventh year, your cash balances over $\$ 235,000$.

Finally I'm sure a few errors crept into this chapter. I'm writing this book related night after working all day and my family breaks my concentration. Remember this is an art not a science and any discrepancies are very minor - anyway you look at this you made a pile of money - the system works! In December 1992 I fixed most of the errors.

Also I kept these examples as simple as possible and didn't use the system to the max. I only adjusted CASH once a year and always bought more shares of the same stock whatever the price. You can take the extra money and buy shares of another stock or one you already own that is at or near its 52-week low. Also I held onto stocks that if I owned for real I would've sold. For example, I would've sold all my Wang B in April 1991 when it hit $\$ 4.37$ and the PORTFOLIO TOTAL was $\$ 66,128$. Also you can adjust your CASH balance more than once a year.

I think you see how you can use the system for your maximum profit. You may think of some good ideas on your own. If you do, please share them with me and I'll put them in the next edition.

Again for simplicity sake, I omitted all the remaining spreadsheets for stocks used in this chapter.
Again they can be found on my website: http://www.jiiinvesting.com - click on Books by
Chapters hotlink and click Chapter 15. Again you will find some useful spreadsheets at the end of Chapter 15 in your free Adobe Acrobat version of my book.

| STOCK/FUND | \% GAIN <br> 1ST YR | PORT. <br> VALUE | \%GAIN <br> 2ND YR | PORT. <br> VALUE | \% GAIN <br> 3RD YR | PORT. <br> VALUE |  |  |

## Chapter 16 Small Investors Take Heart

I hope all you beginning investors are still with me. I'm one of you and I want to show you that this system works for you and to prove it to you using real-world data.

In this chapter I charted our 10 semi-aggressive stocks starting with $\$ 1,000$ in stock and $\$ 500$ in cash. Also I included commission costs. Look at the spreadsheets and see how it is set up. I strongly recommend you include commissions on your spreadsheet.

Let me explain how you figure the commissions into your spreadsheet. It's simple. You merely subtract all commissions from your cash balance. For example: beginning CASH $\$ 500+$ MARKET $(\mathrm{SELL}) \$ 200-$ commission $\$ 24=\$ 676+\$ 3$ interest $=$ next month's CASH total of $\$ 679$.

For additional buys and sells under the system, you do the same thing. You add the amount of the commission to your buy and sell. This is what I did in the spreadsheets in this book. I always bought the full amount the system said and paid the commissions from the cash balance.

For example: look at the January 1986 buy for Alaska Airlines. The system tells you to buy $\$ 248$ worth of stock. You check out the commission schedule and find that your broker charges $\$ 12$ on trades up to 5,000 shares. So you add your buy amount of $\$ 248+$ commission of $\$ 12$ and tell Merrill Lynch Blueprint to buy you $\$ 260$ worth of stock. This will ensure you receive $\$ 248$ worth of stock. Your broker will automatically subtract out their commissions and buy you $100 \%$ of the stock the system told you to buy. My examples do this because the commission is deducted from CASH.

For sells it will be difficult to sell exactly $100 \%$ of the stock the system tells you. As you remember from chapter 2, you tell Blueprint to sell a certain number of shares when you have a sell under the system. Here's what I propose you do: figure out what the commission is going to be and add enough shares to sell to roughly cover the commission.

For example: (I did not do this in the examples in this chapter for simplicity sake) look at Alaska Airlines. On January 1985 the system told you to sell 8 shares but wait - the commission to sell $\$ 119$ worth of stock is $\$ 12$. So you look and see Alaska Airlines is currently selling at $\$ 14.62$ a share. So to cover the commission, tell Blueprint to sell 9 shares. Again Blueprint will automatically
deduct the commission but you have to sell an extra share to cover the commission. Again I strongly urge you to have your CASH in a money market account with your broker.

After you sell any shares of stock, tell your broker to invest your sale proceeds into your money market account. If you tell your broker always investor sale proceeds into your money market account, he or she will do it. You need to stick those proceeds into your money market account to wait for future purchases. You're much better off having your CASH with your broker.

Now look at the summary sheets a few pages ahead and you'll see that as a small investor you are doing very well. Your 10 stock portfolio was up $15 \%$ after one year, up $48 \%$ after two years, up $110 \%$ after three years, and up $527 \%$ after seven years. You're averaging about $75 \%$ simple interest after paying commissions and had no years with losses. After the fourth year we sold five stocks and bought five new ones. After the fifth year we sold the remaining five original stocks and bought new ones. On the next page I give you a summary of why I sold the five stocks. After use the system a while, you'll know when to sell your stocks.

After a while you will understand the stock market and know when you should dump one of your stocks and that will lead to even bigger profits.

At the end of four years I evaluated my portfolio - remember I told you you're not married to your stocks. I would recommend you evaluate your stocks regularly. I have changed my thinking over the years and feel that this is the best advice on when to sell all remaining shares of a stock. Say you bought a stock and the low was $\$ 5$ and the high was $\$ 15$ and you pay $\$ 6$ a share.

Play the system until the price of the stock is near the previous high and then sell all remaining shares rather than the number the system says to sell. Take the proceeds from the sale of the remaining shares and buy another stock you like that is currently at or near its 52 -week low. If you love the stock you just sold, don't despair, it will soon go back to its 52 -week low again and then you can buy it again when another one of your other stocks hits its high and it's time again to sell all remaining shares. Remember you're always trying to improve your portfolio and some stocks need to be retired. It's easy - sell those stocks and buy new ones.

I hope from reading this chapter you see I'm not rigidly telling you to hold all 10 stocks for four years and then sell five of them. I'm giving you a philosophy to follow and illustrating it with examples and showing you the happy results.

So I've looked through my portfolio and decided to sell 5 of the 10 stocks I now own. I'll try to give you brief reasons why I decided to sell. Check the summary to see percent gains for the first four years - again that is in your Adobe Acrobat version of my investing book.

Graco - Graco did well for us the first three years, up $10 \%$ after one year, $63 \%$ after two, and $97 \%$ after three years. But in the fourth year it's down $4 \%$. The stock is plateauing. A check of the fourth year price range shows a low of $\$ 20.12$ and a high of $\$ 33.37$, only a $50 \%$ difference. We started with a PORTFOLIO TOTAL of $\$ 3,040$ after three years and wound up at $\$ 2,978$ - not very good and the price shows a steady decline. Maybe it will bounce up but I can find better stocks at their lows now also. Also the stock is little too high priced - I'd rather have a stock under $\$ 10$ and go for more profits.

Hovnanian Enterprises - stock took a big nosedive in fourth year - total profit declined from $137 \%$ to $110 \%$. Also the company has a heavy debt load that could be weighing it down. I think I can do better with another stock my fifth year.

Continental Info Sys - had to add $\$ 2000$ to buy more stock in fourth year. I've been reading rumors about the company - something seriously wrong could happen - maybe bankruptcy. Let me sell now and buy later if they go into bankruptcy, then the stock will be cheap. Good time to exit.

J P Industries - another loser and fourth year - profits down from $77 \%$ to $38 \%$. Stock doesn't seem promising, time to sell.

Prospector- a bad choice from the start - had only one good year (third year went from $0 \%$ to $60 \%$ ). Gold closed-end funds just don't seem to fluctuate enough to make money under the system - probably take a nuclear war to make gold really go up in value and who wants that - time to sell. Obviously it didn't take a nuclear war to make gold really go up in value as I wrote in the late 1980s. It seemed like crushing European debt, crushing American debt, high unemployment, numerous bank failures, seem to be enough to get gold up over $\$ 1,500$ an ounce.

So I sell my five stocks. I sell my five stocks and divide the total and five new stocks. My total after commissions comes to $\$ 13,950$ that let me start five new stocks at $\$ 2,790$ each. After the fifth year I sell the remaining five original stocks for $\$ 27,985$ which gives me $\$ 5,597$ to start five new ones in the sixth year.

After the fourth year I picked five new stocks quite quickly. I picked the November 1988 issue of Barron's and look for stocks selling near their 52-week low. It's not hard to pick stocks that work well with the system. You're always trying to maximize your profits and the best way is to keep up with the latest stock info so you can have replacements lined up when you need them.

As you can see from the summary sheets, you're ahead $527 \%$ after seven years or $75 \%$ a year simple interest a year after commissions. Your profits will only go higher because commissions will be smaller percentages as your portfolio grows higher. You will get better and better at picking stocks. Enjoy the future - you earned it!

Remember like in the last chapter - increase PORTFOLIO CONTROL $100 \%$ of the buy amount when you buy additional shares with the cash over $1 / 3$ of PORTFOLIO VALUE for the same reasons listed in the prior chapter.

Now a brief exclamation of the stock summary and cash in one account sheets. Again the sheets will be found in your Adobe Acrobat free version of my investing book. The percentage for each year is based on the percent of gain each year regardless of stock. Thus each year's PORTFOLIO TOTAL is divided by $\$ 1,543$, the starting amount for each stock.

On the cash-in-one-account sheets, I kept a running total for each cash balance - for example: if one stock had "borrowed" $\$ 2,000$ and then had a cash balance of $\$ 500$, I showed the cash total as - $\$ 1500$. Also if I sold the stock and it had a negative cash balance, I carried that balance forward with the new stock. For example: Claire's Stores had a starting CASH balance in November 1988 of $\$ 930$ but on the cash summary sheet shows as $\$ 917$ in November 1988 because Prospector finished with the - $\$ 13$ cash balance when I sold it. All Claire's cash balances have $\$ 13$ subtracted from them. You cannot compare the CASH summary sheets to the actual CASH balance sheets in most cases.

The cash summary is merely to show the actual cash balances as poor stocks "borrow" from rich ones. You can see from review of the cash in one account spreadsheet that your CASH balance only went negative for one month, February 1988 and only one negative $\$ 52$. Your balance fluctuated widely for several reasons: one reason is that you are adjusting your cash/stock ratio every year. Also the stock market had downturns and upturns that tended to make most stocks go up or down in large amounts. But isn't this just what you want? YES it is! This caused large sell or by orders that affected both your cash and stock value.

The large fluctuations are perfectly normal to the system. Don't view your CASH total like a savings account or Certificate of Deposit. The only reason for your CASH account is to provide money when it's time to buy cheap stock. A review of the seven-year summary will show you that cash did the job very well. Look what your $\$ 15,430$ has grown to after 7 years - $\$ 96,814$, a $527 \%$ increase. The system is doing exactly what you want it to do. Again look at the numerous spreadsheets at the back of Chapter 16.

| STOCK/FUND | \% GAIN <br> 1ST YR | PORT. <br> VALUE |  | \% GAIN <br> 2ND YR | PORT. <br> VALUE | \% GAIN <br> 3RD YR | PORT. <br> VALUE |  |

## Chapter 17 <br> Epilogue

It has been a real labor of love writing this book. It is taken me eight years under fairly difficult conditions. I have written parts of this book all over the world including Korea, Belgium, Germany, and Texas. I truly believe that for all us small investors this is the best way to invest and make money. Life is getting harder and you truly can't count on anyone but yourself to get ahead. I have tried to show you how. It's up to you to put into use what I have shown you. Don't procrastinate, start today. Buy a stock and start charting it.

I have started a monthly newsletter talking about the AIM system and recommending stocks, ETF's, LEAPs to buy. Remember you will get a free one-year subscription to my newsletter because you were nice enough to buy my e-book. I would be glad to hear any comments you have on the book. Investing has truly become a passion for me. I now have truly found my calling in life and have found a way to help people in the best way possible - this is truly a good way to succeed in life. Now use the advice I've given you and succeed for yourself and your family.

Please write to me as follows:
Jeffrey Weber
2302 Bluffridge
San Antonio, TX 78232
e-mail: jeffe13@hotmail.com
Please tell your friends about the book. They can buy a copy by going to the Smashword.com webpage and since I haven't put the book up on the Smashword site yet just tell your friends to search either my name Jeffrey Weber or the title of the book which will be Jeff's AIM Way to Big Investing Profits-Buy Low Sell High. The book will be selling at a very low price. I think I will price the book at $\$ 3.99$. I'm doing all of my promotion of this book on a shoestring. Any help you can give me will be greatly appreciated by me and your friends who benefit. If you like this book, please tell your friends, and hopefully they will tell their friends, who will tell their friends.

I want to thank you for buying my book. I truly wrote it to help you succeed. I have always wanted to help people and believe God led me to do it this way. May God bless you and always take care of you.

## Chapter 18

## Bonus

As I've worked on this book I have thought of some ideas and others have given me good ideas I'd like to share. Some of these ideas that may have mentioned already but it won't hurt repeating them. Here's the best way to play the system:

1 - Buy your stock initially when it is at or near its 52 -week low
2 - Start looking up the prices of your stocks a few days before it's time to buy or sell
If one or more of your stocks shows strong price changes, then postpone your buy or sell decision and follow the stock closely. I will give you an example: I owned Cray Computer and the day I was about to see if I should buy or sell, Cray went up $\$ 2$ a share from $\$ 8.00$ to. $\$ 10.00$. I waited a day; Cray went from $\$ 10.00$ to $\$ 11.50$. I waited another day; it went from $\$ 11.50$ to $\$ 13.00$. I waited another day, it went down $\$ .50$ a share and I sold based on the system. You can play this game too. If your stock is sharply going up or down, follow it day to day and get the maximum move before you buy or sell.

3 - Here's the key to increased profits (notice I explained earlier that I didn't use it in the seven year averages). Play your stock the regular way until it hits his 52 -week high (the high should be at least $150 \%$ higher than your original purchase price). If you originally bought your stock at $\$ 5$ a share, then $\$ 12.50$ is $150 \%$ higher. When the stock hits the 52 -week high, sell all the remaining shares and use the money to buy another stock at its 52 -week low and repeat the process. You can always buy the same stock back when it's back at its 52 -week low.

I envision you should have enough money to buy at least $\$ 1,000$ words of a new stock with the money you get from selling all remaining shares. Don't worry if you find out you now own \$1, 180 worth of your new stock. You can set up your new spreadsheet the same as you have in the past. Cash is now $1 / 2$ of $\$ 1,180$ or $\$ 590$, which remember is, also $1 / 3$ of your PORTFOLIO TOTAL, if this is a conservative stock - otherwise use $50 \%$ CASH - $50 \%$ shares.

4 - Again readjust your cash/stock ratio at least once a year. More often would be better. Check your ratio after you have a large sale. Remember you make your money buying and selling
stock, not earning interest on your money market account with your broker. And in the days of 2011, your stockbroker is paying a mighty low percent of interest probably $1 \%$ or less.

5 - Keep some of your regular savings money in your money market account. You will make slightly higher interest on your money and you have a little extra cushion in case the system needs a little extra money to make some especially good buys at low prices. We're playing it close to the vest keeping our cash at $1 / 3$ of our PORTFOLIO TOTAL and run the possibility of running out of cash occasionally just when the system is giving us great buys. Having that extra cash there will give you peace of mind. Now you can lend yourself money and you'll be playing the system the way you should. You'll quickly pay back that loan with your profits.

I hope this bonus section also showed you that you too can figure out some ideas on your own that will increase your profits. If so, please share them with me and I'll add them to a revised version and give you credit. Again good investing and to all the best.

## Chapter 19 <br> Jeff's Cardinal Rules for Investing

Now we know how to use these databases, formats and reports. Now you will learn how to use them to find stocks that are worth buying. This database will help you narrow down the stocks to a manageable level. You will find several good online places, Yahoo Finance for one, where you can type in various criteria you're interested in to narrow the range of stocks you want to consider. It is outside the scope of this book to go into great detail into that but if you hunt around on Google and just do searches for stock financial planning help or something like that I'm sure you can find several sources and again I mentioned ways to search for stocks in my newsletter when I give you my favorite website of the week to help you be a better investor. I have several references to places to search somewhere in my previous monthly newsletter sent if you're really interested in it just e-mail me and I will try and find you a couple of good places to look for stocks. Again my e-mail is jeffee13@ hotmail.com

First reread Chapter 8 of this book, to refresh your memory on how to select the right stocks. I'll hit some important points again. First if you're serious about investing, get a subscription to Barron's it's better than ever because now along with your weekly paper subscription you get an online subscription, can't beat that. It's the best source of information I found on good stocks to consider to buy. Every issue will show you many good stocks to consider - from various articles, from the Winners and Losers page in the back of the data section showing you what stocks fell the most that we, or from reviewing the stock tables themselves. Reading Barron's will quickly make you a knowledgeable investor. And you can check one out at your local library to see if you like it.

Below are my cardinal rules for picking stocks that they will explain later in this chapter.

## The Cardinal Rules for Investing

1. Thou shalt only buy a stock that is at or near its 52 -week low
2. Thou shall usually buy a stock that is selling for $\mathbf{\$ 1 0}$ or less
3. thou shalt usually buy stocks with weekly volume over 1 million shares
4. Thou shalt only buy stocks found on the New York Stock Exchange, American Stock Exchange and NASDAQ Stock Exchanges
5. Thou shalt look for stocks with large institutional and/or insider ownership
6. Thou shall buy stocks that have favorable futures and good pasts
7. Thou shall usually buy stocks that pay no or a very small dividend
8. Thou shalt only buy riskier stocks after thou hast bought several more stable stock first
9. Thou shalt usually buy stocks that have long term debt less than $1 / 3$ of the latest revenues
10. Thou shalt buy stocks in industries with the future (for example gambling, biotech, computers, not stagecoaches)
11. Every once in a while you got a break the rules!

These are my 11 Commandments and they will help you make the right choices. As you can see, you will have to take the stocks you found from the databases and do a little more research on them. Research is very easy to do. I will give you the best sources - some are free and some cost a modest amount. You will do better if you have done the research. I'll explain how to use the various research tools to help you choose. But first an explanation of the basic rules.

Rule 1 - Thou shalt only buy a stock or ETF or LEAP or closed-end fund that is at or near its 52 -week low

Remember the saying, "it's not what you buy, but when you buy it". This is the most important rule and the ruled that will help you the most. Following this rule will make you the biggest profits.

The easiest way to find the high and low price is to go to a good financial website like Yahoo. Yahoo's website is http://www.yahoo.com then just click on Finance in the left column and type
in any symbol for any stock or ETF you want information on. Also Barron's has a very good website if you want to look at all the stocks on the New York and NASDAQ stock exchange. Their website is http://www.barrons.com - just scroll down to the bottom and look for the link to stocks which is way down on the bottom.

Also you will find a good list of potential AIM stocks, ETF's and LEAPs in my monthly newsletter that you will receive for free for being kind enough to buy my book.

Other services have good information if you're willing to pay for it. Check out the beginning sections of Value Line - they have a summary listing stocks with lowest price/earnings (P/E) ratios, lows book value, stocks with the highest estimated future returns etc. They also show a section showing high-growth stocks and worst-performing stocks (biggest \% drops). Every issue of Barron's does the same thing in the Winners and Losers section. For additional free info, send off for the latest annual report from the company. When you scroll down the stocks in Barron's, any stock that you see the symbol for clubs next to, you can easily e-mail through Barron's and obtain a free annual report.

Remember at or near its 52-week low - it's the Cardinal Rule for Profits.
Rules two, three, and four are self-explanatory.
Rule 5 - Thou shalt look for stocks with large institutional and/or insider ownership - at least $\mathbf{4 0 \%}$

For this rule and the rest of our rules, we must look to outside research. Just following rules one through four will make us a good profit. But little extra research that doesn't take that much additional time or money and will help us make even bigger profits.

A free source of information is the Standard \& Poor's Reports. Remember like I said earlier you can easily find them in the research section of most online stockbrokers. I know that TD Ameritrade does have Standard and Poor Reports, Zack's Reports and some other research report so you can literally OD on research for free and find out all the information you'd ever want at any particular investment.

Why does owning a stock with a large institutional and/or insider ownership help us? This helps us for several reasons. When a large company holds a big block of stock, that block can actively trade. When institutions buy in big blocks the price will go up, when institutions sell in
big blocks the price will go down sharply. This will help us AIM investors to get the volatile swings that help us make money with AIM. For example one stock I own, US Surgical, plunged $\$ 15$ a share in one day because analysts downgraded the stock because they felt revenues wouldn't grow as fast as they had in the past. That caused many institutions to dump the stock (it wasn't my 33 shares that caused the drop).

Normally when stocks go up or down, the volume traded goes much higher. A stock may average 1 million shares traded a month, then it goes way up or down in price and you see it traded 2 million shares in one week! These volume numbers show the big players were involved. You can take advantage of this - you buy when they sell and you sell when they buy.

Another and better way to find institutional ownership info and wealth of other valuable information for free is again like it been telling you the eight-page Standard \& Poor's Report available for free from most online brokers.

For now were only interested in the institutional ownership info in the Standard and Poor Reports. I'll tell you how to use the reports for other information we want. The place to find Institutional ownership is at the top of page 1. Look for the line "\% held by institutions". For example, I'm looking at Jan CF Pharmaceuticals, on the NASDAQ exchange and the \% of institutional ownership is $66 \%$, very good.

S\&P research reports give you additional related info - insider holdings. If the company has a large block of stock owned by the company officers and directors, it will be listed here. One reason I bought US Surgical (high $-\$ 114$, low $-\$ 28$, I bought at $\$ 30$ ) was because institutions owns $62 \%$, officers and directors own $31 \%$; leaving only $7 \%$ trading with us, the general public.

The place to look for insider holding information is in the eight-page Standard \& Poor's Report. You will quickly find out that Standard \& Poor's literally uses the same standard in every report so once you get familiar with the reports will find the same type of information you are looking for in exactly the same place in the report. The S\&P Reports are really excellent sources of up-to-the-minute info and again I highly recommend them.

## Rule 6 - thou shalt buy stocks and closed-end funds and ETF's that have favorable futures and pasts

What does this mean? Again remember investing is an art not a science. For a favorable past, I like to look at the price history, P/E, revenues, profits (earnings). Let's use US Surgical as an
example. In the Standard and Poor's research report is a section called "Income Component Analysis". Look at the bottom and you see five years of prices and P/E (Price/Earnings) history. The $\mathrm{P} / \mathrm{E}$ ratio is the ratio between share price and earnings per share. If the stock sells at $\$ 10$ and earned $\$ 1$ a share, the $\mathrm{P} / \mathrm{E}$ is 10 . If the stock earned $\$ .50$ a share, the $\mathrm{P} / \mathrm{E}$ is 20.

When I looked at the price and P/E history of US Surgical, here's what I found:

| $\underline{\text { Stock Price }}$ | $\underline{\mathbf{1 9 8 8}}$ | $\underline{\mathbf{1 9 8 9}}$ | $\underline{\mathbf{1 9 9 0}}$ | $\underline{\mathbf{1 9 9 1}}$ | $\underline{\mathbf{1 9 9 2}}$ |
| :--- | :--- | :--- | :--- | :--- | :--- |
| High | $\$ 8.62$ | $\$ 15.31$ | $\$ 35.87$ | $\$ 116.37$ | $\$ 134.50$ |
| Low | $\$ 662$ | $\$ \$ 7.68$ | $\$ 12.06$ | $\$ 31.25$ | $\$ 69.00$ |

| P/E ratio | $\underline{\mathbf{1 9 8 8}}$ | $\underline{\mathbf{1 9 8 9}}$ | $\underline{\mathbf{1 9 9 0}}$ | $\underline{\mathbf{1 9 9 1}}$ |
| :--- | :--- | :--- | :--- | :--- |
| High | 17.3 | 23.6 | 40.5 | 73.7 |
| Low | 13.3 | 11.8 | 13.6 | 19.8 |

No P/E for 1992 because the year wasn't finished at the time I was typing.
Now the price history looks pretty good doesn't it? Well it gets even better. Another item must be checked - stock splits. You will find stock splits highlighted on the chart showing the price movement of any particular stock you are looking at in the Standard and Poor's research reports and maybe elsewhere in the report. When I wrote this about 20 years ago stock split information was under the category "key statistics at a glance", you could find any stock splits in the last five years .Also shown in the chart on front page

Looking again at US Surgical, we find 2-for-1 stock splits in 1990 and 1991. Thus if you owned 50 shares; after 1990 you now own 100 shares and after 1991 you owned 200 shares. Stock splits usually mean the company has been doing well and investors are eagerly buying the stock, pushing the price up. Most companies want to keep their stock prices lower to encourage more people to buy and thus split the stock. I regard stock splits as favorable.

However reverse stock splits (such as 1 for 10), I regard as a warning that this is a risky stock. I also regard this when it comes to leveraged ETF's as a warning but also a chance for profits because the price on the ETF must've come way down in order to institute a reverse split. For example your US Surgical would've gone from 50 shares to 5 shares if a 1 for 10 split occurred. This usually happens in companies where share prices are pretty much near their 52 -week lows. For example, one of my stocks, Saachi and Saachi had a 1 for 10 split and my holdings went from 600 shares to 60 shares and the stock price rose from $\$ .75$ to $\$ 7.50$. Company barely made me a profit, and I got rid of it when it showed a slight profit.

Looking at the P/E high and lows shows you that the stock was profitable all five years. Stocks only have P/E's if the company was profitable. Thus in Barron's, if you see a stock with a blank $\mathrm{P} / \mathrm{E}$, the company lost money in the last measurable period. Looking at the P/E, US Surgical was profitable all five years. Looking at the P/E's showed people were willing to buy with a P/E as high as 73.7.

I bought US Surgical at $\$ 30.25$ when it showed a P/E of 13 . Looking at the five-year history shows me that buying US Surgical was a good deal with a P/E of 13. Normally I like stocks with low P/E's; any stock at 10 or less I want to know more about.

Also in the Standard \& Poor's Report, you'll find revenue and income info. Here is what I found for US Surgical: ( $M=$ millions):

| $\underline{\text { Year }}$ | $\underline{\mathbf{1 9 8 8}}$ | $\underline{\mathbf{1 9 8 9}}$ | $\underline{\mathbf{1 9 9 0}}$ | $\underline{\mathbf{1 9 9 1}}$ | $\underline{\mathbf{1 9 9 2}}$ |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Revenues | 291 M | 345 M | 514 M | 843 M | $\mathrm{N} / \mathrm{A}$ |
| Income | 23 M | 31 M | 46 M | 91 M |  |

The rise in revenues and income shows a good pattern to me. This is a good semi - aggressive stocks with great high/low swings. This is the type of stock to start with and build on. Notice buying the stock violated the rule about buying stocks costing more than $\$ 10$ a share. As rule 11 says, sometimes you gotta break the rules.

Now the future. Read the Business Summary and Important Developments in the Standard and Poor's Report. Towards the back of the S\&P Report you'll get an industry Outlook on the industry your company is in. This will show you whether you have a "stagecoach industry" company or one in an industry with a good future. Also you'll find summaries of the latest newspaper articles that talked about your company. You will also find those on the Yahoo Finance website after you put in the symbol for any particular stock. Always a good idea to look at the latest newspaper articles about any company you're considering buying.

Now after reading all this and Value Line will have pretty much of the same info, do you feel good about the stock? Does it give you a warm fuzzy?

I think if you have done this a few times, that you'll have the ability to decide what stocks are good buys. Your hardest problem will be picking from a group of good buys. Remember you only want a good buy, don't agonize trying to pick the stock of the year. And when you do, you must stick with your stock through thick and thin - don't wimp out and sell at a loss unless there is absolutely no chance the stock will rise again.

## Rule 7 - Thou shalt usually buy stocks (doesn't apply to closed-end funds) that pay no dividend or a small dividend

Most stocks that pay large dividends will never appear in your searches because they don't fluctuate $100 \%$ a year and usually cost over $\$ 10$ a year. One group of buy candidates, closed-end funds, usually do have large dividends. And low prices and $100 \%$ price fluctuations. Have your cake and
eat it too! Over the years I've relaxed my rule of trying to only buy stocks that are $\$ 10$ or less. I have expanded my range to try and give you the best stocks every month and my newsletter regardless of what their price is in terms of absolutely higher or lower than $\$ 10$.

If any stocks that you do own pay a dividend or same with the closed-end fund, I recommend you tell your stockbroker to reinvest your dividends into your money market account and not to automatically buy more shares. Let AIM determine the price you buy shares at and it will make tax time a lot easier for you.

Rule 8 - Thou shalt only buy riskier stocks after thou hast bought several more stable stocks

Each of you knows what level of risk you feel comfortable with. A good book on the subject is The Nature of Risk by Justin Mamis. I recommend you read it.

Stocks come with different risk levels. I'll give you an idea of what I consider "safer" stocks. Then I'll give you an idea of what I consider "riskier" type stocks. You can decide for yourself if riskier stocks have a place in your portfolio. Riskier stocks can offer you for greater profits than safe stocks, but are not for the faint hearted.

Safer stocks are companies with:

- At least $\$ 100$ million in revenues;
- Companies making a profit;
- Companies with share prices higher than $\$ 3$ share;
- Companies with high/low swings less than $300 \%$.

For example, if the low is $\$ 5$ a share in the high is $\$ 15$ this is a safer stock. A riskier stock would be one with a low of $\$ 1$ and a high of $\$ 12$. Safer companies would show steadily rising revenues and income such as US Surgical. Riskier companies often have a bad year or two, lose money and thus the stock drops way down. I bought Synergen, a biotech on the NASDAQ after the price went from $\$ 67$ to $\$ 11$. Riskier stocks can easily rebound and the thus make you bigger profits. If Synergen discovers a hot new drug, the price could shoot back up quickly.

Riskier stocks include stocks in bankruptcy, stocks trading for less than $\$ 3$, and stocks with high/low differences greater than $300 \%$. Stocks in bankruptcy usually have the symbol "VJ" in front
of their name or on the NASDAQ Exchange, the fifth letter in the stock symbol will be Q. This means the company is in Chapter 11 bankruptcy. The courts give the company $3-5$ years to straighten themselves out. This usually means that creditors have agreed to smaller or no payments on debts owed them for a period of time. Normally companies in bankruptcy trade for less than $\$ 3$ share, many times they trade under $\$ 1$ a share. Looks through Barron's and you'll see many stocks trading at $\$ .25$ or less. You might see a high of $\$ 1$ and a low of $\$ .12$. That's a great percentage spread and offers great profit potential but with a greater risk.

I'd advise you to wait until you own three or four safer stocks before you add a riskier stock. Now since the stock is riskier and since it's low priced, you don't need to invest the usual $\$ 1,500$ per stock. Cut this in half, put $\$ 500$ into the stock and $\$ 250$ into your money market and then follow the regular guidelines for setting up the stock. I have changed my tune on this and feel if you are going to go with riskier stocks definitely you need to keep the CASH/SHARE VALUE at 50-50\%. Later on I'll give you a really wild strategy for playing riskier stocks after you've gotten rich from the system. I'd recommend one - two riskier stocks in a 10 stock portfolio for the average investor.

Rule 9 - Thou shalt usually buy stocks with a long-term debt less than $1 / 3$ of current revenues

Stocks with $1 / 3$ or less long-term debt are safer stocks and stocks with high debt levels are riskier stocks. You can find the long-term debt amount under Capitalization in the Standard and Poor Report. An example of a riskier stock is RJR Nabisco holdings - earnings were $\$ 15.7$ billion but long-term debt is $\$ 13.5$ billion.

## Rule 10 - Thou shalt buy stocks in industries with a future

This goes along with rule 6. Look for industries and products of the future. Right now a product of the future that has several stocks at very low prices is solar energy products. The solar energy companies have really taken a dive lately so they may be worth looking at as good investments if you can take a long term view. Off the top of my head biotech, medical, gambling, Internet, social networks, are a few I like.

Right now the medica/drug industry is very depressed because of uncertainty over what President Clinton will do with healthcare. Déjà vu now the meta-health/drug industry is concerned with Pres. Obama will do about healthcare. A little research will reveal very good bargains. But watch out for companies in a dead-end position in a good industry. Right now IBM fits that bill (1980s) -
mainframe computers are dying out. But later IBM was smart enough to reposition itself and has stayed a very successful and profitable company and you will see just how well you would've done buying LEAPs on IBM through the years when you look at my model LEAPs portfolios that you can find on my webpage http://www.jijinvesting.com

If you keep informed about financial information either on the web or in a financial newspaper, you'll find articles showing you industry trends. Read Barron's regularly and you'll have no trouble seeing the good industries of the future.

## Rule 11 - Every once in a while you gotta break the rules

When a great opportunity comes along, you can ignore one or more rules (except rule one!). I violated my rule of only buying stocks under $\$ 10$ when I bought US Surgical at $\$ 30.25$. Why? It was selling at $25 \%$ of its high for the year. It offers low - cost alternative surgical procedures, and revenue growth was still excellent. I recommend that you also do the same and scan stocks over $\$ 10$ for outstanding buys. My monthly list of good buy stocks in my newsletter always includes a few stocks over \$10.

Always remember investing is an art not a science. You make the best choices and then play the system and be patient. You're in this for the long term.

Now I promised you a riskier strategy. This will not be for most of you but I want to get you thinking about exploring the possibilities of the system and this is a good way to do that.

Search stocks and look for all stocks selling currently for $\$ .50$ share or less. Then do the same thing you do with any stocks you're thinking of buying. Find the current high/low and current price and only consider stocks selling at or near their year's low. You could also use this strategy to find one or two riskier stocks to put in your 10 stock portfolio.

Here's the risky strategy. Buy 10 risky stocks selling for $\$ .12$ or less now. Just about all of them should be stocks in bankruptcy. And you know how to check for bankruptcy. Put $\$ 100$ into each stock and do nothing until the stock hits $\$ .50$ a share and then sell all of the stock. This is very easy to do with your online broker. All you have to do is leave a limit order to sell all of your shares at the $\$ .50$ price that is good until canceled. Good until canceled limit orders usually will run for three months so you don't have to worry about missing that one magic day when your stock hits the $\$ .50$ plateau. Your broker's computer will automatically take care of you and make sure you get that sale.

If only four of your 10 stocks do this, that means go from $\$ .12$ to $\$ .50$, you'll be ahead $60 \%$ even if the other six go completely bankrupt. Look at the math below:

| $4 \mathrm{X} \$ 400=$ | $\$ 1,600$ |
| :--- | :--- |
| $6 \mathrm{X} 0=$ | $\$ 0$ |
|  | $\$ 1,600$ |

So you started with $\$ 1,004$ and 4 of your 10 went up to $\$ \$ .50$ so your portfolio went from $\$ 1,000$ to $\$ 1,600$ pretty good, and probably quite exciting watching the roller coaster ride on those 10 stocks.

I nicely ignore commissions, phone calls, etc. because they lower your profits.
If a risky strategy doesn't appeal to you, stick with whatever strategy you feel comfortable with. My strategy, my 11 commandments are designed for the small investor who wants to put $\$ 1,500$ into stock.

If you are large investor and would like to put $\$ 100,000$ into 10 different stocks - please call me immediately. I'll quit my job and work for you and design a perfect strategy for you. Bigger investors can go with more conservative stocks that don't fluctuate $100 \%$. Reread Chapter 9 of my book and learn the conservative strategy to see how successful you can be with really conservative stocks as a large investor.

I hope this gives you some help in picking stocks. By following these ideas, you'll be able to take good stocks with just a little practice. Treat this as a rewarding hobby that will pay you big profits. Keep it fun and remember the system will always tell you the right thing (buy, sell, or do nothing). Just be patient and remember you're going to make a heck of a lot more money from stocks than from banks.

My monthly newsletter soon begins its 18th year. It gives you a list of stocks, ETF's, LEAPs, that I like, ideas for improving the system, and other useful info I think will help you. Please share my flyer with your friends for information and prices.

I truly hope and believe you'll be successful. I want you to achieve your dreams and goals. Use the system to obtain the future you want and deserve.

## Postscript

I received a very nice letter from a four former student who followed my Mark Twain advice and lavished praise on me. But more importantly he took the time to send me a list of rules he devised for selecting stocks that I'd like to share with you. I'd like to publicly thank Steve Donahue of Georgia for sharing these rules and I now hope they will benefit you also. And Steve if you're out there I'd love to hear from you; we have lost touch for far too long.

He prefaced his list of rules with a few comments he gleamed from six months of learning about stock selection (May you all be so dedicated).

Steve had several ideas on determining the health of a company. He said my idea of simply looking at long-term debt as a percent of revenues was a rather weak measurement of debt and quite deceiving at times. He said Barron's, Forbes, Business Week, etc. all refer to Debt to Equity Ratio. But Steve found each publication used a different formula to determine the ratio. (See Barron's Finance and Investment Handbook for three different types of debt/equity ratios). Steve decided to use the following definition:

## Debt to Equity Ratio: Long-Term Debt plus Total Current Liabilities divided by Total Common Equity

Steve says the lower this percentage the better, anything below $40 \%$ he feels is good.
Steve found earnings to be of paramount importance. Very often, publications refer to the Earnings to Equity Ratio. This is a good measure of how efficient and productive a company really is. This is also a measurement of growth in earnings and control of costs. The ratio was also found using several different formulas. Steve felt Value Line had the best formula noted as \% Retained Net Worth on its statistic page of each company (third to bottom column). The higher this percentage the better ( $12 \%$ is about average for an average company). Value Line uses this formula:
\% Retained New Worth (Earnings to Equity Ratio): Net Profit (Net Income after Taxes) divided by Net Worth (common equity)

## Steve Rules for Stock Selection Value Investing

1. Select a stock at or near its' 52 -week low - Here, here!
2. The difference between the high and the low share price should be $100 \%$ or more. Normally the beta of such shares is 1.0 or more (beta compares the ups and downs of the stock's price relative to the general market. A stock with a beta of 1.5 tends to move $50 \%$ more than the total market, a stock with a beta of 0.5 move $50 \%$ less. A stock with a beta of 1.0 moves exactly as the market does).
3. Select stocks with at least 200,000 shares traded weekly on average. 150,000 shares is acceptable for smaller companies.
4. Select low P/E ratio stocks. The Price/Earnings ratio should be well below the P/E of the market as a whole, see Value Line, Part 1.
5. Select a company with a Debt to Equity Ratio of less than $40 \%$. Debt to Equity Ratio equals Total Current Liability plus Long-Term Debt, divided by shareholder common equity. The smaller the company, the smaller this ratio should be.
6. Select a company with Earnings to Equity Ratio of $15 \%$ or better. Earnings to Equity Ratio equals net income after taxes divided by shareholder common equity.
7. Select stocks with at least $\$ 100$ million market capitalization. Market capitalization equals common stock outstanding multiplied by the current share price.
8. Select companies with a history of earnings growth. Avoid a company with an earnings deficit unless you are sure this is a strong company with a promising future.
9. If possible, check out the company's product. Steve checked out Liz Claiborne and hated the product, I believe women's dresses.
10. Find out the stocks' knock. The prices low for a reason. The best choice will be a good company in an out-of-favor industry.
11. Avoid stocks rated a buy any newsletter (including Value Line). I totally agree, the newsletters usually take a short-term outlook and generally favor stocks that are their years high, not low. Of course this rule would never apply to Jeff's newsletter because I
am always picking the type of stocks that you should be consider buying at the current time.
12. Pick stocks with at least $35 \%$ institutional ownership.

I really like Steve's final comments. "Sometimes you can overanalyze the stock. Sometimes the gut feeling is the best formula."

I'd really like to thank Steve for sharing his ideas and I encourage you to do the same so I can share them with other readers. We are all in this together. Let's help each other achieve our dreams.

# Chapter 20 <br> Simple Options Strategies 

I attended a 3-day investing seminar in February 2006 and learned some very simple options strategies that I am adding to my AIM strategy. Options offer excellent ways to vastly increase your profits while you wait for your stocks to rise and make you profits using AIM. First I want to give you the basics about options. I strongly recommend you go to Amazon or eBay and buy a couple of basic books on options. Options and knowledge of trading them is the key to wealth.

Two books I recommend:
Getting Started in Options by Michael C. Thomsett

## Options Trading for the Conservative Investor by Michael C. Thompson

I will start with some basic information so you will have an idea of what I'm talking about later.
Options: An option is a contract (each contract = 100 shares of the stock) between a buyer (option holder) and the seller (option writer) that gives the buyer the right, but not the obligation, to buy (call) or to sell (put) specific stock at a specific price on or before a specific date in exchange for a market premium. If you buy or sell 10 contracts then you control 1,000 shares of a specific stock for a limited period.

Option Holder; Option Writer - The option holder is the person who buys the right conveyed by the option. The holder of a cash settled option has the right to receive an amount of cash equal to the cash settlement amount upon exercise prior to the expiration of the option. The option writer sells the option to the option holder.

Cash Settlement Amount - The cash settlement amount is the amount of cash that the holder of the cash-settled option is entitled to receive upon exercise of the option. It is the amount by which the exercise settlement value of the underlying interest of the cash-settled call exceeds the exercise price of a cash-settled call, or the amount by which the exercise price of a cash-settled put exceeds the exercise settlement value of the underlying interest, multiplied by the multiplier for the option.

Here's an example of the cash settlement amount:

Assume that the holder of a cash-settled option on XYZ stock that has an exercise price of 80 exercises it when the exercise settlement value of the stock is 85 . If the multiplier for XYZ stock is 100 ( 1 contract), the assigned writer would be obligated to pay, and the exercising holder would be entitled to receive, the cash-settled amount of $\$ 500$ ( $\$ 85$ minus $\$ 80$ multiplied by $100=\$ 500$ ).

Exercise Price - The exercise price, also called the "strike price" is the price at which the option holder has the right either to purchase or to see the underlying stock.

For example: A physical delivery XYZ 40 call gives the option holder the right to purchase 100 shares of XYZ stock at an exercise price of $\$ 40$ a share. A physical delivery XYZ 40 put option gives the option holder the right to sell 100 shares of XYZ stock at an exercise price of $\$ 40$ a share. The exercise price of a cash-settled option is the base for the determination of the amount of cash, if any, that the option holder is entitled to receive upon exercise.

Expiration Date - This is the date on which the option expires. If an option has not been exercised prior to its expiration, it's worthless - that is the option holder no longer has any rights and the option no longer has any value. The expiration dates are fixed by the options market on which the series trades. Very important you know and understand what the expiration date is for any options you buy.

When you look options up on the on the web, and again Yahoo Finance is a great place to find all the information you need on options such as the expiration date current price etc. For example you might see XYZ stock options with March, April, July dates listed. These are the months when the option expires. Almost all options expire on the third Friday of the month listed as the expiration month. For regular options normally there are monthly expiration dates extending out for five or six months. You will see later on that our strategy is very concerned with the month our options expire in.

Unit of Trading, Contract Size - The unit of trading, also called the contract, of a physical delivery option is the amount of the underlying interest that is subject to being purchased or sold on the exercise of a single option contract.

For example: a physical delivery XYZ 50 call will give its holder the right upon exercise to purchase 100 shares of XYZ at $\$ 50$ per share. If the option is trading at a premium (profit) of say, $\$ 4$ per share, then the aggregate premium for a single option contract would be $\$ 400,100$ shares $\mathrm{X} \$ 4$ a share.

Multiplier - The multiplier determines the aggregate value of each point (dollar) of the difference between the exercise price of the option and the exercise settlement value of the underlying interest. Almost all of our multipliers will be 100 because each contract contains 100 shares. So a multiplier of 100 means that for each point or dollar by which a cash-settled option is in the money upon exercise, there is a $\$ 100$ increase in the cash settlement amount. So for example, if an option with a multiplier of 100 is trading at a premium of say $\$ 4$, then the aggregate premium for single option contract would be $\$ 400$.

Exercise - If the holder of a physical delivery option wishes to buy (in the case of a call) or sell (in the case of a put) the underlying interest at the exercise price - or, in the case of the cashsettled option, to receive the cash settlement amount, he must exercise his option. To exercise an option, option's holders usually give exercise instructions to their brokerage firm in accordance with the firm's policy.

Premium - The premium is the price that the holder of an option pays and the writer of an option receives for the rights conveyed by the option. It is a price set by the holder and writer, or their brokers, in a transaction in an options market when the option is traded. The premium is not a down payment. It is simply an entirely nonrefundable payment in full - from the option holder to the option writer. The holder pays the writer of the right to hold the option for a specific period of time.

Just like with stocks, the premium trades after the initial sale - it can go up or down based on what XYZ stock is doing. The factors that mostly generally affect the pricing of an option include such variables as the current value of the underlying interest (current XYZ stock price) and the relationship between that value and the exercise price, the current value of related interests (e. g. futures on the underlying XYZ stock or interest related to XYZ stock) the style of the option, the individual estimates of market traders on the future volatility of XYZ stock, the historical volatility of XYZ stock, the amount of time remaining until the option expires, cash dividends payable on the underlying stock, exchange-rate in the case of foreign stocks, current interest rates.

You see that many factors can affect your option - but don't worry about this too much. We will be using simple option strategies that don't require us to look at these many factors. The above explanation covers all options strategies - we are just concerned about three options strategies.

Opening Transaction - This is the purchase or sell transaction which opens our position or increases our position in the call or put option.

Closing Transaction - This is the transaction we make at some time prior to the expiration of our call or put option. Here's what we do: we make an offsetting sale of an identical option, or the option writer makes an offsetting purchase of an identical option. A closing transaction in an option reduces or eliminates an investor's previous position as the holder or the writer of that option.

For example: in June an investor buys December XYZ 50 call at an aggregate premium of $\$ 500$. By September the market price of the option has increased to $\$ 700$. To gain his $\$ 200$ profit, the investor can direct his broker to do an offsetting December XYZ 50 call in the closing transaction. On the other hand, if by September the market price of the option has decreased to $\$ 300$, the investor might still decide to see the option in a closing transaction thereby limiting his loss to $\$ 200$. Remember the option will expire the third Friday of December - on that date the option is worthless.

Although option holders have the right to exercise at any time before expiration, holders frequently elect to realize their profits or losses by making closing transactions because the transaction costs (commissions) of the closing transactions may be lower than the transaction costs associated with exercises, and because closing transactions may provide an opportunity for an option holder to realize the remaining time value (described below) of the option that would be lost in an exercise (why wait until December when you can sell and buy or sell another option in September and start making money with that option!)

Combination; Spreads and Straddles - Combination positions are positions in more than one option at the same time. Spreads and straddles are two types of combination positions. A spread involves being both the buyer and writer of the same type of option (puts or calls) on the same stock, with the options having different exercise prices and/or expiration dates.

Covered Call Writer - If the writer of a physical delivery call option owns or acquires the amount of the underlying stock that is deliverable upon exercise of the call, he is said to be a covered call writer. This is one of the simple option strategies I will teach you! You will use this with one or more of your stocks. You will use this only on stocks that show little bullish or bearish movement, basically the price is staying around the same amount.

For example: an investor owns 100 shares of XYZ, stock. If he writes one physical delivery XYZ call option - giving the call holder the right to purchase his 100 shares at a specified price - this would be a covered call. Unless you're an expert, NEVER do "naked calls" - that means an investor who writes a call but does not own the stock - if you are wrong you could lose a lot of money!!

At the Money - This term means that the current market value of the stock is the same as the exercise price of the option. If the stock is selling for $\$ 25$ a share in the exercise price of the option is 25 that stock is "at the money".

In the Money - A call option is said to be "in the money" if the current value of the underlying stock is above the exercise price of the option. A put option is said to be "in the money" if the current market value of the underlying interest is below the exercise price of the option.

For example: if XYZ stock is selling at $\$ 43$, a XYZ 40 call would be in the money by $\$ 3$. If $X Y Z$ stock was selling at $\$ 37$, a XYZ 40 puts would be in the money by $\$ 3$.

Out of the Money - If the exercise price of a call is higher than the current value of the underlying stock or the exercise price of the put is below the current market value of the underlying stock, the option is said to be "out of the money".

For example: with a current market price of XYZ stock at $\$ 40$, a call with an exercise price of $\$ 45$ would be out of money by $\$ 5$. With the current market price of $\$ 35$, a put with an exercise price of $\$ 30$ would be out of the money by $\$ 5$.

Intrinsic Value and Time Value - It is sometimes useful to consider the premium of an option as consisting of two components: intrinsic value and time value. Intrinsic value reflects the amount, if any, by which an option is in the money. In the examples, the call options had an intrinsic value of \$5

Time value is whatever the premium of the option is in addition to its intrinsic value - this is the "emotions" in the market - based on what people emotionally think the stock will do. And option will normally never be expected to trade for less than its intrinsic value prior to expiration, although occasionally this would happen.

Here's an example of a call with intrinsic value: when the current market price of XYZ stock is $\$ 46$ a share, a XYZ 40 call would have an intrinsic value of $\$ 6$ a share for each contract or each contract ( 100 shares) has an intrinsic value of $\$ 600$. If the market price of the stock were to decline to $\$ 44$, the intrinsic value of the call would be only $\$ 4$ a share or $\$ 400$ per contract. Should the stock dropped below $\$ 40$, the call would have no intrinsic value.

Here's an example of a put with intrinsic value: When the current market price of XYZ stock is $\$ 46$ a share, a XYZ 50 put would have an intrinsic value of $\$ 4$ a share or $\$ 400$ per contract. The price of the stock climbed above $\$ 50$ share, the put would have no intrinsic value.

Example of Time Value - When XYZ stock is $\$ 40$ a share, XYZ call may have a current market value of say, $\$ 2$ a share or $\$ 200$ per contract. This is entirely time value - someone out there wants the right to be able to buy XYZ stock at $\$ 40$ a share say any time in the next three months because he or she thinks XYZ stock will go up and they will make a profit.

An option with intrinsic value may often also have some time value as well - that is, the market price of the option may be greater than its intrinsic value. This could occur with both a call and put option.

For example: the market price of XYZ stock at $\$ 45$ a share, a XYZ 40 call may have a current value price of $\$ 6$ a share ( $\$ 600$ per contract), reflecting an intrinsic value of $\$ 5$ a share and a time value of $\$ 1$ share.

An option's time value is influenced by several factors (as described under "premium") including the length of time remaining until expiration. And option is a "wasting" asset; if it is not sold or exercise prior to its expiration, it will become worthless.

From the little bit of glancing I've done looking at options, I'd say that emotion rules and you will find plenty of options that you can buy that could be traded and are a good choice. We will look for these kinds of options in using our covered call strategy.

Transaction costs - The transaction costs of options investing consists primarily of commissions (which are charged for opening and closing transactions just as with stocks. If you are a riskier trader and use margin (borrow money from your broker) then you will incur interest costs as well. I am NOT recommending anyone use margin until they feel very comfortable using option strategies. And even then I think it's a bad idea. Always realize options are riskier than buying stocks - don't get in over your head until you are an expert swimmer!!

## Principal Risks of Option Positions

Here I will discuss the potential risks with options trading. It is very important that you understand all the possible risks before you start options trading!

Biggest Risk - An option holder runs the risk of losing the entire amount paid for the option in a relatively short time - several months or several years. This risk reflects the nature of an option as a wasting agent that expires in a short time and becomes worthless when it expires. An option holder who neither sells his option in the secondary market nor exercises it prior to expiration will necessarily lose his entire investment in the option.

The fact that options become valueless upon expiration means that an option holder must not only be right about the direction (up or down) of an anticipated price change in the underlying stock but must also be right about when the price change will occur. If the price of an underlying stock does not change in the anticipated direction before the option expires to an extent sufficient to cover the cost of the option (premium) the investor will lose all or a significant part of his investment in the option. This contrasts with that investor buys a stock directly and may continue to hold the stock forever hoping it will move in the direction he wants.

The significance of this risk to an option holder depends in large part upon the extent to which he utilizes the leverage of options to control a larger quantity of the underlying stock than he could have purchased directly with the same investment amount. The example below compares the consequences of three different approaches to investing the same of amount of money in stock or options, with each approach involving a different degree of leverage.

Example - Assume that investors A, B, and C each have \$5,000 to invest and that each anticipates an increase in the market price of XYZ stock, which is currently $\$ 50$ a share. Investor A invests is $\$ 5,000$ in 100 shares of $X Y Z$. Investor B invests $\$ 500$ in the purchase of XYZ 50 call option (one contract for 100 shares of XYZ at a premium of $\$ 5$ a share) and invests the remaining $\$ 4,500$ in relatively risk-free investments such as Treasury Bills. (We'll assume in this example that all of the calls are purchased when they have six months remaining until expiration and that the risk-free investment bears interest at an annual rate of $3.25 \%$ - which means that a $\$ 4,500$ investment will earn approximately $\$ 73$ and interest over six months). Investor $C$ invests his entire $\$ 5,000$ in 10 XYZ 50 calls ( 10 contracts @ $\$ 500$ each - $\$ 5,000$ ).

If each option is held for six months and, if it is profitable, is either sold or exercised immediately before it expires, the following illustrates the dollar and percentage profit or loss that each investor would realize on his $\$ 5,000$ investment depending upon the price of XYZ stock when the option expires. Increased leverage ( $\$ 5,000$ worth of options controls 10 contracts which controls 1,000 shares) results in greater profit potential on the upside and greater risk of loss on the downside. Investors C , as the most leveraged investor, would realize the highest percentage return if the price of XYZ increased to $\$ 62$, but would suffer up $20 \%$ loss even if XYZ increased to 54 (assuming he did not sell his options while they had significant remaining time value, and would lose all of his investment if the price of XYZ stayed at or below 50 .

The more an option is out of the money and the shorter the remaining time to expiration, the greater the risk that an option holder will lose all or part of his investment in the option. The greater the price movement of the underlying interest necessary for the option to become profitable (that is, the more the option is out of the money when purchased and the greater the cost of the option) and the shorter the time within which this price movement must occur, the greater the likelinood that the option holder will realize a loss.

This does not necessarily mean that an option must be worthwhile to exercise in order for a holder to realize a profit. Instead, it may be possible for the holder to realize a profit by selling an option prior to its expiration for more than its original cost even though the option never becomes worthwhile to exercise. (The shorter the time remaining until expiration, the less likely it is that this will be possible - don't expect to make much if you sell your option a day before it expires!

## Risks of Option Writers

An option writer may be assigned an exercise at any time during the period the option is exercisable. Starting with the day it is purchased, an option is subject to being exercised by the option holder at any time until the option expires. This means that the option writer is subject to being assigned an exercise at any time after he has written the option until the option expires or until he has closed that his position in a closing transaction.

If an option that is exercisable is in the money, the option writer can anticipate that the option will be exercised, especially as expiration approaches. Once he is assigned an exercise, the assigned writer must deliver (in the case of a call) or purchase (in the case of a put) the underlying stock (or pay the cash settlement amount in the case of an in the money cash-settled option). The consequences of
being assigned an exercise depend upon whether the writer of a call is covered or uncovered, as discussed below. We will only use the covered call strategy.

The writer of a covered call forgoes the opportunity to benefit from an increase in the value of the underlying stock above the option price, but continues to bear the risk of a decline in the value of the underlying interest.

Unlike a holder of the underlying stock who has not written a call against it, the covered call writer has (in exchange for the premium) given up the opportunity to profit from an increase in the value of the underlying stock above the exercise price. If he is assigned an exercise, the net proceeds that he realizes from the sale of the underlying stock pursuant to the exercise could be substantially below its prevailing market price.

Example: when XYZ stock was $\$ 45.00$ a share the investor collected $\$ 4$ a share premium by writing an XYZ 50 delivery call. As expiration approaches, the stock has risen to $\$ 58$ a share and he is assigned an exercise. His total return, in addition to any dividends received, will be the $\$ 5$ per share gain (from $\$ 45.00$ to $\$ 50.00$ ) plus the $\$ 4$ premium per share collected when the option was written - \$8 a share less than the $\$ 58$ he could've sold the stock for if he had not written the option - but still a very nice profit!

On the other hand, if the value of the underlying stock declined substantially below the exercise price, the call is not likely to be exercised and, depending upon the price paid for the underlying interest, the covered call writer could have an unrealized loss on the underlying stock. AIM would then tell you it's time to buy more shares and you will pocket the option premium paid by the buyer of your option.

## Long-Term Options - LEAPs

In addition to normal options, about $10 \%$ of optionable stocks also have LEAPs options available for trading. LEAPs is an acronym for Long Term Equity Anticipation Securities. LEAPs are no different from normal options, except their expiration dates are for a much longer time span. All LEAPs are January options which means they expire on the third Friday in January of whatever year they expire. LEAPs are usually available for the January of the following year and maybe the year after that. For example, even as I write this in November 2011, January 2014 LEAPs have been issued on many stocks and more will be issued the rest of this month so you could have a LEAP with a time span of over two years.

Normal options have an expiration date of one to six months at maximum - usually on most options you can get expirations as short as one month on a new option. Like I said above some LEAPs are good for even longer than one year. You can find what stocks have LEAPs by going to $\mathrm{http}: / / \mathrm{www} . c b o e . c o m$ and clicking on the top bar I believe you will find a button that will say LEAPs and it will identify all stocks (equities) that have LEAPs from A to Z.

Sometime between the sixth and eighth month point from its expiration date, the LEAP will be converted to a normal option.

## Bid and Ask Price

Somebody has to sell you the option and make a market in options. They like to get paid for doing that. They like to get paid very well for doing that. They are paid very well for doing that. So that is why when you see an option quote, notice that there is a bid price as well as an ask price.

So you might see XYZ 50 call June with the bid price of $\$ 2$ and an ask price of $\$ 2.15$. The bid price (lower one,) is the price that we can sell our option for. The ask price (the higher one) is the price that we can buy the options for. The difference between the bid and ask prices is called the bid-ask spread. This is how floor traders get rich. This is the (cost of doing business) like commissions, don't worry about it. Look at the option tables and you'll see the differences between bid and ask is now very small - sometimes just a penny. Losing money on the bid and ask difference will not put a dent in your profits.

## Volatility of the Stock

Volatility of the stock will be an important factor in our covered call strategy. Options tend to have an amplified impact by the movement of the stock. The more a stock fluctuates, the higher the volatility of that particular stock. A stock can fluctuate both up and down.

Here's an example:
ABC stock moves up and down in the $\$ 10$ range each day. However, this particular stock closes at or near the same price every day.

XYZ stock moves in a $\$ 1$ range each day. However at the end of the trading day, the stock moves up $\$ 1$ dollar each time.

Even though the end-of-day price differences are larger each day for XYZ, the amount of intraday fluctuation is much greater for ABC ; therefore ABC tends to have a much higher volatility.

When we use our covered call strategy described later, we want stocks that are very conservative, not volatile. We just want a steady, boring monthly income for our calls that we sell backed up by the stock we own.

## The' Delta' of Change

There are a lot of good Greek words in investing - beta of a stock means how volatile the stock is. A big beta means big price swings. Here we are concerned with the "Delta" of an option which the rate of change for our option compared to the increase in the stock price.

An example should explain this for you.
Let's say we buy a call option on XYZ stock at the strike price - so if the stock is $\$ 80$ a share, we buy a $\$ 80$ strike price call.

If our stock goes to $\$ 81$, our call was likely to go up $\$ .50$ for a Delta of .5 .
If our stock goes to $\$ 82$, our call is more likely to go up $\$ .75$ for the $\$ 1$ stock increase or a Delta of . 3 .

If our stock goes down to $\$ 79$, our option is likely to lose $\$ .50$ in value for a . 5 Delta (or your option value goes from $\$ 1.00$ to $\$ .50$ share or from $\$ 100$ to $\$ 50$ per contract.

If our stock goes down to $\$ 78$, it is likely to lose another $\$ .30$ or your option went down to $\$ .20$ or each contract is now worth $\$ 20$.

If our stock goes down to $\$ 77$, likely to lose another $\$ 1.00$ or your option goes down to $\$ .10$ and each contract is worth $\$ 10$.

If our stock was down to $\$ 76$, your option is likely to be worth $\$ .03$ or $\$ 3$ per contract.

## Important Points

## 3 basic trends:

- bullish - stock will go up
- bearish - stock will go down
- stagnant - stock doesn't go up or down, just stays near same price.

A trend is different from a pattern - look for patterns within trends.
Continuation Trend - the Trend is Your Friend
Support and resistance run parallel
Support - price point where stocks stops going down
Resistance - price point where stock stops going up
If bullish - price will go up
If stagnant - price will stay the same
If bearish - price will go lower
To determine what trend is for a stock - look at charts for at least 12 months - what is the stock doing? Going up? Going down? Going sideways? (Stagnant?)

Also look for news about the stock - is it good? Bad? Things happening to the company? Are earnings forecast to go up? Down? Are revenues growing? I may add to my newsletter some recommendations for potential stocks that I feel will work for the option strategy I will give you. And I have started identifying which stocks I am recommending for the month that have LEAPs.

But you really need to learn to do research on your own to make the most profits with options. You really need to be able to give yourself a good reason why you are optioning a particular stock.

Check the sentiment on the stock. Are analysts saying buy, sell? The Standard and Poor Reports are an excellent source for this info. Get familiar with the free research your broker has that you can look at. My broker, TD Waterhouse, has excellent research to let you bring up charts on stocks, look at S\&P reports and Reuter reports and many other research tools. The more you know the better you will do with options.

Again check the overall economy, how is the U.S. economy doing, our jobs being created? Maybe they were being created when I first wrote this in the 80s but they sure as hell aren't being created in 2011 as I write this and edit it.

## Key to Success

Get core groups of stocks - say $5-10$
Become intimately familiar with them
Know as much as possible
Then trade them over and over
Change strategy as needed
Keep losses small
Have a plan

## Perfect Trading System

Simple
Time efficient
High returns
Low to no risks
Repeatable
Consistent
Low capital (funds) needed
Fun
Low fees
Remember 85\% of all options expire worthless - this statistical make you feel good when I explain our covered call strategy.

## Options as a Trading Vehicle

With options you get the right to control a stock for a limited period of time. You also gain leverage as you can control the stock with an option for far less money than if you buy the stock. Remember our examples - 100 shares of XYZ stock at $\$ 50$ a share costs $\$ 5,000$. We can probably buy an option call on XYZ Strike 55 call with five-month expiration for $\$ 1.00$. So for the same $\$ 5,000$ we could buy 50 contracts (I'm ignoring commissions here) or control 5,000 shares for the same money we can buy 100 shares.

That's the principle of leverage. And a small movement in the price of the stock will give us a large percentage increase. Earlier I told you that when a stock is at its strike price, it goes up quite sharply. Even on an out of the money option, the XYZ option will probably go up at least $\$ .25$ if the stock goes from $\$ 50$ to $\$ 51$ at the beginning of the option. So you will be up $25 \%$ if the stock just goes up $\$ 1.00$.

I may repeat myself at times in this chapter and that's good. I want to hammer home many points about options and repetition is a good way to do that. Please make sure you understand this whole chapter well before you start trading options because as I said earlier - it is riskier than trading stocks or ETF's because of the time expiration factor.

Below I will show you again the great profit potential of options and their great leverage.
Be sure you understand what commissions you will be paying to your broker for options before you begin trading. Also make sure you completely understand how to buy the correct option of the correct stock before you start trading. If you don't understand how to do that from the broker's website, call your broker and have him or her explain how to you. From my experience brokers have made it very easy to identify exactly what option you want to buy. They'll be glad to help you. And in no time at all, you will feel comfortable buying options yourself from the broker's website.

One other thing before we get into the covered call options. The Securities and Exchange Commission is concerned for investors investing in options and they want you to read a pamphlet basically called the risks of options and your broker will want you to sign something saying you have read this pamphlet and do understand that options are risky.

## Strategy \#1 - Buy Call Options

ABC stock is selling at $\$ 26$; you buy one call contract option at $\$ 30$ and pay $\$ .75$ per option share or pay $\$ 75$ for one contract of 100 shares. The commissions are very low so I'm ignoring them in these examples.

The "buy call option" gives you the right but not the obligation to buy ABC at $\$ 30$ a share for a specific period of time (we will use 5-6 months' time period for this strategy.)

For example: if you buy the call option in March 2006, you will be buying the call option expiring in August 2006 or September 2006 (remember they expire the third Friday of the month when they expire).

Below is potential for profits of options.
Remember you always want long time periods at least five - six months if you buy a call option, and if you want for longer, maybe even years, then buy LEAPs.

And
A short time if you sell a call option.
You buy the call option at $\$ .75$ for one contract. If you lose all of your investment, you lose $\$ 75-$ so this strategy meets our goal of limited losses. We may decide to buy $2-3$ contracts if we really feel bullish about this stock over the next $4-5$ months. A couple of months ago Google would've been a good stock to buy call options on - now it seems to be a good stock to buy puts on again this was written 20 years ago so it might not be true today.

Let's say the price is $\$ 28$ a share three days after we buy our option. The stock owner is ahead $7 \%$ on the increase in the stock price. Option owners are now $100 \%$ (your option bought for $\$ .75$ is now $\$ 1.50$ per share or $\$ 150$ per contract. You can sell the contract for the $\$ 150$ because there is someone else willing to buy your option because he or she feels ABC will continue to go hire - the trend is bullish.

Let's say a week later stock price rises from $\$ 28$ to $\$ 30$ - bullish trend continues. Stock prices ahead $15 \%$ but option premium has risen from $\$ 1.50$ per share to $\$ 2.50$ per share or each contract rose from $\$ 150$ to $\$ 250$. You are ahead $233 \%$ on your options. Than a month later stock goes to $\$ 32$. The stock is ahead $23 \%$ but the option is ahead $466 \%$ ! You see the power of options.

I recommend the buy call options (gives you the right to buy a stock at a certain price for a specific period of time) for stocks you are bullish on, stock you feel will go up. Remember that my newsletter is giving you stocks at or near their 52 -week lows. The stocks are definite candidates for buying a call. This is a low dollar amount risk that could lead to good profits. I will start identifying stocks I think are possible stocks that you may want to buy an option on.

Again remember that the normal options are usually good for as long as six months or so. But also there are long-term options - LEAPs which will expire in the third Friday in January of whatever particular year they expire in. I will suggest possible option candidates but I don't have the time to determine if all of my choices are even optionable. You can look at any I suggest in my newsletter by going to Yahoo Finance and typing in the symbol and seeing what options are available for that particular stock. You will find a nice example of an option listing I took from an earlier issue of Barron's but it's just too big and bulky to put in an e-book so again go to your free Adobe Acrobat version to look at this spreadsheet.

## Barron's Option Listing Example

| DuPont | Mar | 12.50 |  | 1558 | 5658 | 0.20 | 0.10 | 0.15 | +0.05 | Weeks High |

| 41.00 | Apr | 40.00 |  | 3180 | 11414 | 1.95 | 1.25 | 1.85 | +0.28 |  |
| 41.00 | Apr | 40.00 | p | 711 | 10200 | 1.05 | 0.55 | 0.55 | -0.35 |  |
| 41.00 | Jul | 40.00 |  | 533 | 5596 | 2.65 | 2.20 | 2.50 | +0.10 |  |
| 41.00 | Jul | 40.00 | p | 173 | 7787 | 1.90 | 1.45 | 1.45 | -0.20 |  |
| 41.00 | Oct | 40.00 | p | 132 | 219 | 2.10 | 1.85 | 1.85 | ... |  |
| 41.00 | Apr | 42.50 |  | 4221 | 15456 | 0.65 | 0.35 | 0.60 | +0.15 |  |

| 41.00 | Apr | 42.50 | p | 420 | 8364 | 2.70 | 1.80 | 1.80 | -0.60 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 41.00 | Jul | 42.50 |  | 1004 | 8087 | 1.45 | 1.05 | 1.45 | +0.20 |
| 41.00 | Oct | 42.50 | p | 223 | 262 | 3.70 | 3.20 | 3.30 | +0.20 |
| 41.00 | Apr | 45.00 |  | 238 | 10285 | 0.15 | 0.05 | 0.15 | +0.05 |

The above gives an example of how Barron's list options. The above shows the put and call options available on DuPont. They list weekly option prices after the market closes every Friday. This is a good way to see how your option is doing. Once you own an option you should track it daily as far as I'm concerned. And again time to radically change for the better for investors because now you don't have to think about looking them up in a paper publication you can easily check the option prices for any stock very easily in Yahoo Finance. Remember the prices are per share so you have to multiply the price you see in Yahoo Finance X 100 to get the value of your contract.

If any stock you buy a call option on hasn't moved in two - three months, you should strongly think of selling your option and only incurring a small loss. Remember that options have the time value. The closer an option gets to its expiration date, the less it is worth. You can't win every battle with options. Cut your losses and try again - you can even sell your option that has only two - three months remaining in likely buy another option on that same stock that doesn't expire for six months and that option will be cheaply priced because of the downward trend.

Normally stocks in the $\$ 20$ price range have strike prices set $\$ 2.50$ apart. So on a stock selling for $\$ 20$, you will find options with strike prices of say $\$ 20, \$ 22.50, \$ 25$ and maybe even $\$ 27.50$ or $\$ 30$. The higher the strike price, the cheaper the call option. I would recommend paying a little more and getting a call option that is only slightly out of the money.

For example, if the stock is selling at $\$ 20$, I would recommend buying a call option with a strike price of $\$ 22.50$ or $\$ 25$ but not higher.

## $2^{\text {nd }}$ Strategy - Covered Calls

A covered call means you own the stock when you "sell" a call giving the buyer the "right" to buy your stock for a set period of time at the strike price. Use this strategy when you feel your stock is stagnant or bearish in the short term. When you "sell" a call, you ARE OBLIGATED to sell your stock to the buyer at the strike price.

You ask yourself - why am I doing this? You are doing this because you get to keep the premium from the buyer of your call option. Remember that call options are sold as contracts and each contract is for 100 shares - so if you own 325 shares do not sell more than three contracts ( 300 shares) worth of call options. You do not want to be "naked" when you sell call options (not own the stock that you are selling calls on).

Here's an example of what I propose you do:
Determine your outlook on the stock - you must feel the stock is stagnant, not likely to have a large price increase in the near future. You can look at your AIM spreadsheets and see what the price of the stock has been for say the last five or six months. And again you can always go to Yahoo Finance, type in the symbol of your stock, and then look up the historical prices of your stock on a weekly or monthly basis to see if it has been stagnant, not likely to have large price increases. You can look at your AIM spreadsheets and see what the price of the stock has been for say the last five or six months. And if there is no dramatic news that will boost the stock in the next month, then that is the stock you should sell call options on.

Sell call options against the stock - remember don't sell more call option contracts than you own stock on - see the above example - pick an expiration date - for this strategy we want a short strike price date. Pick the next month's expiration date. So if this is March 6, 2006, sell call options within April 2006 strike date - one month or so is the right time. You want - you want these options to expire worthless.

Pick strike price "out of the money". Pick the first one that is out of the money. So if your stock is selling at $\$ 18$ a share, the first strike price out of the money is $\$ 20$. Thus the stock has to go up to at least $\$ 20$ before the option has intrinsic value to the buyer

So here's our example:
XYZ stock currently selling at $\$ 18$ a share - you own 200 shares.
You sell 2 call option contracts (all 200 shares) to the buyer, giving the buyer the right to buy your stock for $\$ 20$ a share (strike price). Notice the option is out of the money.

For selling the buyer 2 option contracts, the buyer pays you a premium of $\$ 1.25$ a share on 200 shares $\mathrm{X} \$ 1.25$ = equals $\$ 250$. THE $\$ 250$ IS YOURS TO KEEP FOREVER!

Three possible things can happen to your stock - goes up, stays stagnant, or goes down.

$$
274
$$

Let's say it goes up: say it goes from $\$ 18$ to $\$ 20$ - here's how you did:
Goes to $\$ 20$ (unlikely you even have to fill the order - likely your broker just fills the order since it is at market price). Here's how you did:

- Made $\$ 250$ from the option buyer
- Made $\$ 400$ if you had to sell the stock

You made $\$ 650$ which works out to a rate of return of $18 \%$ in one month and your stock only went up $11 \%$ !

Let's say the stock stays stagnant (doesn't go up or down very much):

- $\quad$ Stock still at $\$ 18$
- Keep $\$ 250$ from call buyer
- Then sell another call option for the following month May 06 for another $\$ 250$
- Make 7\% profit in one month on a stock that didn't move!

Let's say the stock goes down:

- Say stock is selling at $\$ 16.75$
- You have broken even - the stock is down $\$ 250$ but you made $\$ 250$ from selling the 2 options. And your "loss" is a paper loss. AIM might tell you to buy some more shares because AIM feels that long-term the stock will go up. So you really didn't lose any money!

Always use short-term options not - LEAPs (long-term) options for the covered call strategy.
Remember with our strategy you want to sell "out of the money" calls (strike price is higher than stock currently selling for). You use out of the money options because the purpose of this strategy is to generate income from the premium you receive for selling the call.

You do not have to wait until an option expires to close it. You can close it and roll it over with options at a higher strike price.

You want to roll over your options. You want the income you earn from selling calls to continue month after month. So you want to roll over your calls. So as soon as one of your covered calls
expires worthless because the stock did not go high enough for the buyer to exercise the option, you figure out a good strike price for next month and sell to more options against the shares you still own.

This lets you make a steady income from the premiums and let you hold onto your stock while waiting for it to go up. If you choose to have a short call and that call got exercised (very unlikely) then you would make profits both on the premium and on the rise in the stock. You can then either buy another stock that is at or near its 52 -week low or rebuy the original stock if you still like it. But if you don't want to have to sell the stock, you can avoid that by rolling over your options for higher strike price options.

For example: you sell a call with a strike price of $\$ 25$ when your stock is $\$ 21$. Let's say your stock has risen to $\$ 24$. You can close out your 25 call option and buy another option with a strike price of $\$ 27.50$. You can often roll forward and up and gather higher net premiums.

## Third Strategy - Aggressive

This is a good strategy for stocks that are stagnant, mildly bullish. We have the same outlook for XYZ stock - we feel the stock is stagnant and unlikely to go up much. XYZ is selling for $\$ 18$ a share in February 2006.

- Buy the right to buy the stock (the call)
- Buy as close to the money as possible (for $\$ 18$ stock, buy the $\$ 17.50$ strike price call - by more time, get a five-month call - expires July 2006, the third Friday of the month. Let's assume the call costs 44 a share. For this example will assume you buy 12 contracts for \$4,800 (1,200 shares X \$4 a share).
- Then sell 20 call options at same Strike price of $\$ 17.50$ expiring in March 2006 (you sell for $\$ 1,200(1,200$ shares times $\mathrm{X} \$ 1$ share premium $=\$ 1,200$.

## Three Possible Outcomes

## Stock goes up:

Say stock goes to $\$ 20$.

- Keep \$1,200 selling premium - obligation to sell ends third Friday in March 2006
- Make $\$ 2,400$ more - sell call options which are worth $\$ 2$ each more than you paid, now worth six dollars).

Keep \$1,200 premium
Make $\$ \underline{2,400}$ on stock
$=\$ 3,600$ profit
$75 \%$ return on stock you never owned.

## Stock stays stagnant:

- Keep $\$ 1,200$ ( $25 \%$ return in one month).
- Still own long term buy option
- Sell another one month sell option (probably bring in $\$ 1,150$ )

## Stock goes down:

(Must go down $\$ 1.50$ a share for you to lose money):
If the stock starts to go down - buy $\$ 17.50$ put option (gives you the "right" to sell the stock at $\$ 17.50$ a share no matter how far down it goes. Probably you had to pay a premium of $\$ .90$ a share. Buy the same number of contracts you previously had call options on - 12 contracts.

Doing that gives you a profit of $3 \%$. You keep $\$ .10$ a share. You make $\$ 1$ a share on the premium you sold $(\$ 1,200)$ and you paid $\$ 1,080$ for the 12 put contracts to eliminate your risk on the 12 call contracts you bought earlier.

## Recommended Broker

At my class where I learned about options, our instructor strongly recommended using Options Xpress for trading options - visit their website at http://optionsxpress.com

Their rates appear quite reasonable to me. They charge a $\$ 1.50$ per contract so in the above example 12 contracts would cost you $\$ 18$. It's easy to place an order according to our instructor - I haven't tried to yet. You don't need to be a computer expert. Their site does have a lot of educational material to help explain options.

Please read all the information you can on options - there are fortunes to be made and you become familiar with all the various options strategies. With the right strategies you can practically eliminate risk. Once you open an account it is very easy to get a current quote. Just type in the stock symbol and Options Xpress will give you all the put and call opens and their current prices for any stock if that stock trades options.

Also, Steve, our instructor, said that Options Xpress will let you "paper trade" as a game with no real money involved. Again, you need to open an account and you can open an account for no money and fund it later. There is a hotlink right at the top of the Options Xpress homepage that you click to paper trade. Again I haven't tried that yet either. I'm too busy typing away so you get this chapter sooner rather than later!!

I would highly recommend that you paper trade for a month or two before doing this for real. But don't be like the guy Steve told us about. This guy told Steve he was making $\$ 100,000$ a year
trading options on paper. Steve asked him: "How long have you been paper trading"? The guy said: "15 years"! Sad, very sad.

Again remember is very easy to find out current quotes on any options by using any of numerous websites including Options Xpress to check on option prices.

## Useful Websites for Option Prices

My favorite is again that very useful site Yahoo Finance. Again all you have to do is click on Finance and type the symbol in the box click, enter and when the summary page for the stock appears, just look on the left and click on the options button and you will see all of the various options listed. The option prices always defaults to the most current option or the one that will expire in the shortest period of time. When you look above the prices for that option you will see hot links to other months and even other years as they organize the option prices by the shortest of the longest. So LEAPs which will say for example now include January 12, January 13, January 14, will always be on the far right side at the top of the current option prices at all you have to do is click on either say January 13 or January 14 and you will suddenly see all of the prices for those particular options it is very easy.

Our instructor said roughly $1 / 3$ of all stocks have options. Usually there are options on the betterknown, higher volume stocks. There are no options on stocks trading for less than $\$ 5$ unless originally that stock was trading much higher at the times the options were sold, for example Citibank.

I recommend you scroll through the options listing and get a feel for which stocks trade options and what prices for options are like. And it isn't only stocks that can have options, many ETF's also have options and could prove to be an excellent trading vehicle for options. You will see more about ETF's in a later chapter.

## Chapter 21 How to Use LEAPs with and without AIM

Now you have read my book and you see how AIM operates. You see that it works best with volatile investments - ones that have good high/low swings so AIM can do its buying and selling. Well, now after many years of searching, I have found the perfect investment for AIM - LEAPs.

LEAPs are long-term options on many of the stocks and ETF's that are household names and many others. About 1,000 stocks on both the New York Stock Exchange and NASDAQ National Stock Market have LEAPs and again many ETF's also have LEAPs.

Here's Jeff's quickie review on LEAPs. LEAPs are derivatives - they "derive" their value from their parent's stock. LEAPs only have value if the stock has value. And as the stock goes up and down, the LEAP goes up and down. All LEAPs are more than a year away from ending - as of November 4, 2006 the two classes of LEAPs you can buy are either one's expiring in January 2008 or January 2009 - the January 2010 expiring LEAPs will probably come out in early 2007.

You need to understand some basic option knowledge. All options, including LEAPs have basic terminology you need to know. You need to understand this terminology. Don't worry; I won't overwhelm you - just the basics. Here are the four terms you need to know: "in the money" "out of the money", "at the money" and "strike price". I'll go over these terms briefly, you will find them listed and explained in the previous Chapter, Chapter 20.

Regarding Strike Price, you need to understand that each LEAP can have many strike prices some are "in the money", one could be "at the money" and some could be "out of the money". Below is an example:

Let's say Yahoo is currently selling at $\$ 26.16$ (it is on November 3, 2006).
Below are the call LEAPs available with the January 2008 expiration and their current price (note: price below was for one share - LEAPs are sold in 100 share lots called contracts so multiply the price below 100 to get the price of one contract.

| Calls | $\underline{\text { Last }}$ | $\underline{\text { Chg. }}$ | $\underline{\text { Bid }}$ | $\underline{\text { Ask }}$ | $\underline{\text { Vol. }}$ | $\underline{\text { Open Int. }}$ | $\underline{\text { Strike }}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| @YHQKC | 11.00 |  | 11.10 | 11.30 | 0 | 222 | 15.00 |
| @YHQKW | 9.10 |  | 8.60 | 8.80 | 0 | 324 | 17.50 |
| @YHQKD | 6.10 | -.50 | 6.10 | 6.30 | 20 | 2,325 | 20.00 |
| @YHQKX | 3.70 | .20 | 3.70 | 3.80 | 242 | 13,923 | 22.50 |
| @YHQKE | 1.45 | -.25 | 1.40 | 1.50 | 2223 | 69,237 | 25.00 |
| @YHQKY | .25 | -.10 | .20 | .25 | 3191 | 44,810 | 27.50 |
| @YHQKF | .05 |  | .00 | .05 | 690 | 14,085 | 30.00 |
| @YHQKZ | .03 |  | .00 | .05 | 0 | 2,127 | 32.50 |
| @YHQKG | .05 |  | .00 | .05 | 0 | 134 | 35.00 |
| @YHQKU | .05 |  | .00 | .05 | 0 | 2 | 37.50 |

Since the price is $\$ 2616$, any strike price higher than $\$ 26.16$ is "in the money" and any strike price lower than $\$ 26.16$ is "out of the money". And when you look today in 2011 at Yahoo Finance option prices, you will see that the symbols for options have legally changed and are much different than the symbols you see above under the call's column. Strike price merely means the price you have a "right" to buy the stock at for the term of the LEAP. With call LEAPs, the option will go higher when the stock goes higher.

|  |  |  | Jan 09 | Dell | Call | LEAPS |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Stock | Symbol | Stock Price | $\frac{\text { Strike }}{10}$ | $\frac{\text { Strike }}{\underline{15}}$ | $\frac{\text { Strike }}{\underline{20}}$ | $\frac{\text { Strike }}{\underline{25}}$ | $\frac{\text { Strike }}{\underline{30}}$ | $\frac{\text { Strike }}{\underline{35}}$ | $\frac{\text { Strike }}{40}$ | Strike 45 |
| Dell | DELL |  |  |  |  |  |  |  |  |  |
| LEAP | WDQ |  |  |  |  |  |  |  |  |  |
| 28-Jul-06 |  | \$22.03 |  |  |  |  |  |  |  |  |
| 29-Jul-06 |  | \$22.16 |  |  |  |  |  |  |  |  |
| 1-Aug-06 |  | \$21.37 |  |  |  |  |  |  |  |  |
| 2-Aug-06 |  | \$21.98 |  |  |  |  |  |  |  |  |

| 18-Sep-06 |  | \$21.30 | \$12.70 | \$9.30 | \$5.90 | \$3.50 | \$2.05 | \$1.10 | \$0.65 | \$0.45 |
| 21-Sep-06 |  | \$21.19 | \$12.70 | \$9.30 | \$5.80 | \$3.30 | \$1.95 | \$1.05 | \$0.60 | \$0.30 |
| 22-Sep-06 |  | \$21.28 | \$12.70 | \$9.30 | \$5.70 | \$3.30 | \$1.95 | \$1.05 | \$0.60 | \$0.30 |
| 25-Sep-06 |  | \$21.74 | \$12.70 | \$8.80 | \$5.70 | \$3.50 | \$2.00 | \$1.20 | \$0.60 | \$0.30 |
| 26-Sep-06 |  | \$22.31 | \$12.70 | \$9.70 | \$5.70 | \$4.00 | \$2.00 | \$1.20 | \$0.60 | \$0.30 |
| 28-Sep-06 |  | \$22.51 | \$12.70 | \$9.70 | \$6.60 | \$4.00 | \$2.00 | \$1.45 | \$0.60 | \$0.30 |
| 2-Oct-06 |  | \$23.28 | \$12.70 | \$9.70 | \$6.90 | \$4.50 | \$2.50 | \$1.60 | \$0.85 | \$0.30 |
| 3-Oct-06 |  | \$22.92 | \$12.70 | \$9.70 | \$7.20 | \$4.20 | \$2.50 | \$1.60 | \$0.85 | \$0.30 |
| 5-Oct-06 |  | \$22.95 | \$14.40 | \$9.70 | \$7.00 | \$4.20 | \$2.50 | \$1.60 | \$0.85 | \$0.30 |
| 6-Oct-06 |  | \$23.00 | \$14.40 | \$9.70 | \$7.00 | \$4.60 | \$2.50 | \$1.60 | \$0.85 | \$0.30 |
| 16-Oct-06 |  | \$24.61 | \$14.40 | \$10.40 | \$8.10 | \$4.90 | \$3.30 | \$1.75 | \$1.05 | \$0.30 |
| 18-Oct-06 |  | \$24.63 | \$14.40 | \$11.90 | \$8.10 | \$5.20 | \$3.30 | \$1.75 | \$1.10 | \$0.30 |
| 19-Oct-06 |  | \$23.16 | \$14.40 | \$11.90 | \$7.60 | \$4.40 | \$2.70 | \$1.85 | \$0.85 | \$0.30 |
| 20-Oct-06 |  | \$23.52 | \$14.40 | \$11.90 | \$7.00 | \$4.40 | \$2.55 | \$1.45 | \$0.85 | \$0.30 |
| 24-Oct-06 |  | \$23.36 | \$14.40 | \$11.90 | \$7.30 | \$4.40 | \$2.55 | \$1.45 | \$0.85 | \$0.30 |
| 25-Oct-06 |  | \$22.99 | \$14.40 | \$11.90 | \$7.30 | \$4.60 | \$2.55 | \$1.45 | \$0.85 | \$0.30 |
| 26-Oct-06 |  | \$23.27 | \$14.40 | \$11.90 | \$7.30 | \$4.60 | \$2.55 | \$1.40 | \$0.75 | \$0.30 |
| 31-Oct-06 |  | \$23.95 | \$14.40 | \$11.90 | \$7.30 | \$4.60 | \$2.55 | \$1.65 | \$0.75 | \$0.45 |
| 1-Nov-06 |  | \$24.52 | \$14.40 | \$11.90 | \$7.30 | \$5.30 | \$2.55 | \$1.85 | \$1.00 | \$0.60 |
| 2-Nov-06 |  | \$24.81 | \$14.40 | \$11.90 | \$8.30 | \$5.20 | \$3.20 | \$1.85 | \$1.00 | \$0.60 |

You can see that LEAPs become cheaper in price the higher the Strike price is out of the money. But realize that the stock doesn't even have to go higher than the Strike price for you to make profits. If other investors think the stock could possibly go up, then the price of the LEAP will go up. I'll show you that when you see how price movements have gone on several LEAPs I have been tracking have done in the last several months. You will see "deep out of the money" LEAPs that have at least doubled in price even though the stock price is nowhere near the strike price.

All you need is the possibility that another investor thinks the stock could go way up. That's all it takes. All you need is to be smarter than the other investors and have a plan and a strategy is up as I am giving you and you will make very high profits. Again look in your free Adobe Acrobat version of my investing book and you will see a nice spreadsheet showing how prices on a LEAP for Dell computers did over a period of several months.

Looking at the spreadsheet I just told you about that you can easily see in the Adobe Acrobat version of my book you can see that even the Strike 45 LEAP doubled in price from October 26, 2006 to November 1, 2006 even though the stock only went up in price from $\$ 23.27$ to $\$ 24.81$. You see the power of LEAPs as investing vehicles! Also you can see why I am suggesting an AIM strategy for LEAPs. Looking over the Strike 45 LEAP over the short period shown above (August 7, 2006 two November 2, 2006) here's the price swings you see:

| 7 Aug price is $\$ .20$ | 10 Aug price is $\$ .45$ | $125 \%$ gain! | We sell! |
| :--- | :--- | :--- | :--- |
| 10 Aug price is $\$ .45$ | 21 Sep price is $\$ .30$ | $50 \%$ drop | We buy! |
| 21 Sep price is $\$ .45$ | 31 Oct price is $\$ .45$ | $50 \%$ gain! | We sell! |
| 31 Oct price is $\$ .45$ | 1 Nov price is $\$ .60$ | $33 \%$ gain! | We Sell! |

Below you will see how just checking the LEAPs price once a month - not even following the above price swings still has major tremendous profits. I will be showing you several ways to play LEAPs so you can pick the method that is best for you.

Below I will show you how one LEAP model portfolio has done:

## Yearly Gains (Losses) for Jan 09 In the Money LEAPs

| LEAP | Starting | Current | \% Gain | Time |
| :--- | :--- | :--- | :--- | :--- |
| Portfolio | Port Value | Port Value | (Loss) | Period |
| Jan 09 in the \$ | $\$ 495,000$ | $\$ 648,397$ | $31 \%$ | Aug - Dec 06 |

I still keep track of this model portfolio so if you wanna see how it is currently doing just go to my website http://www.jijinvesting.com and near the top of the page click on the hot link to how model LEAP portfolios are doing. Every month in my newsletter that you will be getting for free, you will see the latest up-to-date detailed information on the two model LEAP portfolios and two other model portfolios - one showing how bear ETF's are doing, and one showing how the most conservative of blue-chip stocks are doing under the AIM system.

Here are the stocks that I picked LEAPs on for the above model LEAP portfolio:
AMD Strike 20, Amazon Strike 25, Citibank Strike 40 (only real bomb I picked for the model portfolio), Dell Strike 20, DR Horton Strike 20, Ford Strike 5, eBay Strike 25, Intel Strike 15, Symantec Strike 15 and Yahoo Strike 25. You will see when you look at the modern portfolio as of November 2011, that the stocks have changed. Again you are not married to either stocks or LEAPs and can always sell an old one and replace it with a new one if you like the new one better and I will help you decide when you will want to get a better new one.

This portfolio is up $31 \%$ in just two months and all I did was look at the price for each of the 10 LEAPs listed above and make buy and sell decisions just like I would with AIM stocks - $31 \%$ in 4 months just by checking the LEAPs once a month is pretty impressive to me. Only takes about one hour a month to manage this way and you still make very impressive profits.

The other way that would take more time but would result in more profits is to monitor your LEAP prices at least once a day and on any day you see a large rise or fall in your LEAP price, you use AIM and make either a buy or sell. You would probably be trading 5-10 days a month but would be rewarded with even higher profits. I'll do the above price switches on the example above to show you. I'll assume we started with 50 contracts as is used in the above $31 \%$ gain example. You'll see that just by making the few trades are listed in the in the example you accomplish two important things:

- First you made big profits - went from $\$ 1,500$ to $\$ 3,211$ - a $114 \%$ gain in less than three months which works out to an annual gain of $456 \%$ - not too bad!
- Second you reduce your risk - we went from owning 5,000 shares or 50 contracts to owning 2,000 shares or 20 contracts.

## Strategies for LEAPs

I am going to give you some strategies for playing LEAPs. You know your situation - the amount of money you want to invest, your risk level. I will let you know if the strategy I suggest is risky, conservative or somewhere in the middle.

First of all, while LEAPs are volatile, overall I don't consider them risky... Unless you let your emotions rule your investing. If you can't handle LEAPs going up and down $50 \%$ in short periods of time, then LEAPs are not for you. Because they're going to do that. (My investor's Jan 13 Strike 5 LEAP on Bank of America went from $\$ 3.70$ a share to $\$ 1.75$ a share and so we made our first buy (following my rule - don't any more LEAP contracts until a LEAP has dropped 50\%!) But if you understand the complete strategy and where you will be way down the road investing in LEAPs, then you will not worry and be quite happy because you're going to make huge profits.

First, what are the best stocks to buy call LEAPs on? Well, I apply the same rules I employed with what are the best stocks to invest in - namely ones that are at or near their 52-week low. I have started focusing on stocks at or near their lows in my monthly newsletter - this will give you a starting point for good stocks I feel that will go up. And if the stock goes up, the LEAP really goes up. Since I originally wrote this I have added a new feature to my monthly newsletter and you will find that I list whether or not the stock has LEAPs for all the stocks and ETF's I recommended in my newsletter.

Now the stocks are a little more risky. If you want to be conservative and still use LEAPs then do LEAPs with conservative stocks, with Dow Jones stocks. Every month I bring you the Dow Jones stocks and you see they have done very well over the last 13 years as I wrote this probably longer today. And they will keep doing well over the long term. So if you want to be conservative, stick with them. If you wish to see if a stock has LEAPs, then go to http://www.cboe.com, click on Products at the top and then click on LEAPs, then click on Equity and you will get an A to Z list of stocks with LEAPs.

And if you're really obsessive-compulsive like I am, you can download the file of all of their LEAP options to an Excel spreadsheet, then you can laboriously go through that list and delete all the options that do not have LEAPs. Then you could put break page breaks at the end of each letter of the alphabet so each new letter starts at the top of a new page, then you can print out the entire list of LEAPs from A to Z and put them in a spiral binder with letter tabs to identify each letter of the alphabet. That's what I've done and it makes it much easier every month to check the stocks I am recommending in my newsletter and find out whether they have LEAPs or not.

## Strategy \#1

Strategy \#1 is for investors to have larger sums of money and are risk takers and willing to make large profits. Here's what the strategy entails: you have 10 LEAPs, each LEAP has anywhere from 10 to 50 contracts, and you make buys and sells as AIM tells you either monthly or setting stops and limits. The only difference between selling stocks and LEAPs is that when you sell LEAPs you have to sell contracts not shares. So basically when AIM gives you a buy or sell signal you check the amount of money to buy or sell and divide by the price of a contract to see how many contracts to buy or sell. For example if AIM gives you a MARKET ORDER (SELL) for $\$ 1,800$ and a contract is worth $\$ 600$, then you would sell three contracts.

As I showed earlier, the best way to manage a portfolio like this is to check prices daily or leave limit orders for both buys and sells and again any limit orders would be "good till closed". For example, if your LEAP is selling at $\$ .50$ - then you could have a sell at $\$ .75$ and a buy at $\$ .25$. When either of these occurs, then you set up new buy and sell limits.

You won't have to do this a lot. If you look at the above example, we had 4 buys and sells over a three month period. And you can do this with two basic types of portfolios - "in the money" and "out of the money". I think but cannot prove yet which one will do better. The main difference is that LEAPs are much cheaper when they are out of the money so that portfolio would have a lot more contracts than a portfolio of LEAPs in the money. I think both would do well and you can see both are doing well when you check my webpage and see the up-to-date information on the model LEAP portfolios. I will show you how the two January 2008 in the money and out of the money portfolios are doing and how the two January 09 in the money and out of the money portfolios are doing.

The advantage of the out of the money portfolios is that it is much cheaper. Look at starting dollar amount of that in the money and out of the money portfolios below and you will see that out of the
money is substantially cheaper. Also the portfolios below started with 50 contracts each. I think you could do this with a minimum of 10 contracts each (though I feel more contracts is better). Look at these portfolios and again all I did was arbitrarily make buy and sell decisions once a month. You would've made even more money by checking prices daily or setting stops and limits and leaving standing by in sell orders with your broker. Look below at the model portfolios for January 2008 and January 2009.

Yearly Gains (Losses) for Jan 2008 In the Money LEAPs

| LEAP | Starting | Current | \% Gain | Time |
| :--- | :--- | :--- | :--- | :--- |
| PORTFOLIO | Port Value | Port Value | (Loss) | Period |
| Jan 08 in the \$ | $\$ 402,000$ | $\$ 551,761$ | $37 \%$ | Aug-Dec 06 |

The January 2008 in the money portfolio consists of: AMD Strike 17.50, Amazon Strike 25, Citibank Strike 45, Dell Strike 20, (and actually I'm dictating/typing this book revision on a Dell) Inspiron 530 desktop computer!), DR Horton Strike 20, eBay Strike 22.50, Ford Strike 5, Intel Strike 17.50, Symantec Strike 15, and Yahoo Strike 25.
\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$

Yeary Gains (Losses) for Jan 08 Deep Out of the Money LEAPs

| LEAP | Starting | Current | \% Gain | Time |
| :--- | :--- | :--- | :--- | :--- |
| Portfolio | Port Value | Port Value | (Loss) | Period |
| Jan 08 out of \$ | $\$ 34,125$ | $\$ 73,001$ | $114 \%$ | Aug-Dec 06 |

The January 08 Deep Out of the Money portfolio consists of: AMD Strike 50, Amazon Strike 55, Citibank Strike 70, Dell Strike 40, DR Horton Strike 45, eBay Strike 50, Ford Strike 15, Intel strike 30, Symantec Strike 30, and Yahoo Strike 50.
\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$
Yearly Gains (Losses for Jan 09 In the Money LEAPs

| LEAP | Starting | Current | \% Gain | Time |
| :--- | :--- | :--- | :--- | :--- |
| Portfolio | Portfolio | Port Value | (Loss) | Period |
| Jan 09 in the \$ | $\$ 495,000$ | $\$ 648,397$ | $31 \%$ | Aug-Dec 06 |

The Jan 09 In the Money portfolio consists of: AMD Strike 20, Amazon Strike 25, Citibank Strike 40, Dell Strike 20, DR Horton Strike 20, Ford Strike 5, eBay Strike 25, Intel Strike 15, Symantec Strike 15, and Yahoo Strike 25.
\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$
Yearly Gains (Losses) for Deep Out of the Money LEAPs

| LEAP | Starting | Current | \% Gain | Time |
| :--- | :--- | :--- | :--- | :--- |

| Portfolio | Port Value | Port Value | (Loss) | Period |
| :--- | :--- | :--- | :--- | :--- |
| Jan 09 Out of \$ | $\$ 102,375$ | $\$ 154,248$ | $51 \%$ | Aug-Dec 06 |

The Jan 09 Deep Out of the Money portfolio consists of: AMD Strike 40, Amazon Strike 45, Citibank Strike 70, Dell Strike 40, DR Horton Strike 30, eBay Strike 60, Ford Strike 10, Intel Strike 30, Symantec strike 30, and Yahoo Strike 40.
\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$
The above gains in only two months are impressive - if you project them out for the whole year you have an annual rate of return of around $150 \%$. Would you be happy averaging $150 \%$ a year for many years? I sure would! And again this is only spending an hour a month checking that once prices and then making buys and sells. I will post some spreadsheets showing what LEAP spreadsheet looks like - it's just slightly different than a stock spreadsheet. And again all these spreadsheets will be found in your free Adobe Acrobat version of my book. The only difference is on a couple of the headings to identify contracts and not shares are traded. And I like adding a column showing how many contracts are owned.

Below I'm going to show you the spreadsheets for the January 09 "out of the money" portfolio. Then I will show you how strategy \#1 will work. Remember you can either just check the prices once a month or you can set limits and stops and then you will always have buys or sells said when the price of the LEAP makes a move. Overall if you have the time and want higher profits, you should check daily.

$\square$

You have to remember just like using AIM with stocks that every time you make a buy or sell you MUST fill out your AIM spreadsheet. You may have to fill out your sheet a couple of times a month. It's no big deal as you know how easy it is to fill out an AIM spreadsheet. It's still simple arithmetic - adding, subtracting, multiplying and division. If I can do it, you certainly can do it.

You will quickly see the power of AIM when you see the spreadsheets. Since I am new at this, I plan to be conservative. So when you see big cash amounts on the sheets, know I am leaving the cash there and NOT going to get back quickly to $1 / 3$ CASH and $2 / 3$ LEAP. I will be conservative until my research tells me not to be and shows me that I should be putting the cash back into LEAPs. And I will have no problem supplying the Chapter 2A bear strategy to LEAPs if I need to either.

I haven't figured out when I should get out of the JAN 08 LEAPs. Remember they will expire worthless on the third Friday of Jan 08. I plan to be out of them long before that. Right now I think my idea is to sell all the Jan 08 LEAPs and buy the Jan 10 LEAPs when they come out - not sure when that is, probably early in 2007. Please check out the spreadsheets after only three months and you will see what a great match AIM and LEAPs are. Again you will find lots of spreadsheets showing exactly what the LEAPs did in the free Adobe Acrobat investing book.

Check the Dell Strike 45 LEAP in this chapter and you will see that the price went from $\$ .20$ to $\$ .60$ so if you had just bought and held (our infamous lump-sum investor, you would have to "paper" value of $\$ 4,500$ and would be higher the $\$ 3,211$ you see above. But (1) you would still own 50 contracts - above we have reduced our risk and now only own 20 contracts. (2) When do the "lump sum" investors sell? He or she doesn't know - maybe too late! Since the above LEAP as easily more than doubled in three months, that's plenty of "real" profits - real profits are always better than "paper" profits.

## Strategy \#2

Let's say you like the idea of LEAPs but think having a portfolio entirely of LEAPs is a bit extreme. That's a perfectly valid viewpoint also; everybody has a different level of risk and different investing objectives. Different strokes for different folks. Well, then why not have 8 stocks and 2 LEAPs or 7 stocks and 3 LEAPs? You can sleep at night because you are comfortable with that risk level. I just want to encourage you to have at least 1 or 2 LEAPs in your portfolio because as you see they do so well.

## Strategy \#3

Remember how I told you every once in a while you have to break the rules? Well, for some friends of mine I am doing a different strategy. They wanted to invest $\$ 500$ each for their two daughters. So I helped them by recommending 3 different LEAPs they could buy for their $\$ 500$. Since they wanted to invest $\$ 500$, I concentrated on "out of the money" LEAPs which are cheaper. I came up with the following:

- Yahoo - Jan 08 - buy 3 LEAP contracts at Strike Price $45=\$ 45$ times X $3=\$ 135$
- Citibank - Jan 09 - buy 1 LEAP contract at Strike Price $\$ 170$
- Dell - Jan 09 - buy 2 LEAP contracts at Strike Price $\$ 60$ X $2=\$ 120$

That's a great way to invest $\$ 500$. I gave them a rule of thumb to sell any of the contracts when they double in price. Then take the principle of profits and invest in more LEAPs. You can see the power of compounding with LEAPs.

I am no options or LEAP expert. But just by applying simple AIM investing techniques, you can make substantial profits with LEAPs - much higher profits then you could make just by using stocks alone. I feel very comfortable using LEAPs because they overcome one of the problems with options - they exist for very long periods of time. Heck, under AIM, you should be selling many of your stocks when they hit their highest in less than two years and replacing them with other stocks selling at or near their lows.

Bottom line, I hope I've convinced you that LEAPs are great way to use AIM to its maximum potential. Again I am willing to manage portfolios for people who want to buy LEAPs.

Again I always wish you happy investing and rising profits!

## How to Guarantee Profits on Profitable LEAPs

Look at the above LEAP (spreadsheet will be on the page before this in the Adobe Acrobat version) and you will see it has been very successful and profitable. The LEAP has gone from $\$ 3.12$ on November 15, 2006 to its current price of $\$ 6.90$, more than double. And you will see that you have started with 35 contracts (3,500 LEAP shares) and now own only 17 contracts, or 1,700 LEAP shares left. AIM is doing what it's supposed to - selling profitable shares for you.

And we still have until January 2009 before this LEAP expires. How can we guarantee that we keep these (paper) profits on the remaining 17 contracts without selling now? How can we hold on and see if we will get even more profits in the future, to protect ourselves if AT\&T has a sudden downturn? This simple answer and it's called a "stop loss".

Below I will give you the formal definitions of several types of orders and stop losses and explain how we can use them to protect earned profits and let us still strive for higher future profits.

## Market Order

A market order is a buy or sell order to be executed by the broker immediately at current market prices. As long as there are willing sellers and buyers, a market order will be filled.

A market order is the simplest of the order types. Once the order is placed, the customer has no control over the price at which the transaction is executed. The broker is merely supposed to find the best price available at that time. In fast-moving markets, the price paid or received maybe quite different from the last price quoted before the order was entered. And you can't place a market order after the market is closed the night before. I favor only using limit orders when you're dealing with LEAPs.

## Limit Order

A limit order is an order to buy a security at no more (or sell at no less) than a specific price. This gives the customer some control over the price at which the trade is executed, but may prevent the order from being executed (filled).

A buy limit order can only be executed by the broker at the limit price or lower. For example, if an investor wants to buy a LEAP but doesn't want to end up paying more than $\$ 4$ for the LEAP, the investor can place a limit order to buy the LEAP at any price up to $\$ 4$. By entering a limit order
rather than a market order, the investor will not be caught buying the LEAP at $\$ 4$ or higher if the price rises sharply.

A sell limit order can only be executed at the limit price or higher.
A limit ordered to buy may never be executed if the market price surpasses the limits before the order can be filled. Because of the added complexity, some brokerages will charge more for executing a limit order than they would for a market order. I haven't found that to be true nowadays. And you can execute limit orders that are "good till canceled" which means the broker will keep the limit order open for three months automatically so you don't have to worry about missing a limit order buy or sell because you were watching the ticker every minute.

## Stop Order

A stop order (also stop loss order) is an order to buy (or sell) a security once the price of the security climbed above (or dropped below) a specified stock price. When the specified stock prices reached, the stop order is entered as a market order (no limit).

With a stop order, the customer does not have to actively monitor how we stock is performing. However because the order is triggered automatically when the LEAP price is reached, the LEAP price could be activated by a short-term fluctuation in a security's price. Once the stop price is reached, the stop order becomes a market order. In a fast-moving market, the price at which the trade is executed maybe much different than the stop price. The use of stop orders is more frequent for stocks, and futures, that trade on an exchange rather than in the NASDAQ stock market.

A sell stop order is an instruction to sell at the best available price after the price goes down below the stop price. A sell stop price is always below the current market price. For example, if an investor holds the stock currently valued at $\$ 50$ and is worried that the value may drop, he/she can place a sell stop order at $\$ 40$. If the share price drops to $\$ 40$ for whatever reason, the broker will sell the stock at the next available price. This can limit the investor's losses (if the stock price is at or below the purchase price) or lock in at least some of the investors profits (if the value of the security has risen between when the security was originally purchased and the stop order placed).

A buy stop order is typically used to limit the loss (or to protect an existing profit) on a sale. A buy stop price is always above the current market price. For example, if an investor sells a stock short (selling short) hoping the stock price goes down in order to give the borrower shares back at a
lower price (covering), the investor may use a buy stop order to protect himself against losses if the price goes too high.

Stop orders are the complement of limit orders. In a stop order, a desired selling price (ask price) is always below and a desired buying price (bid price) is always above the current price. In limit orders it is the other way around; the desired selling prices above and the desired buying price is below the current price.

## Stop-Limit Order

A stop limit order combines the features of a stop order and a limit order. Once the stop price is reached, the stop-limit order becomes a limit order to buy (or to sell) at no more (or less) than a specified price.

As with all limit orders, stop-limit order may never get filled if the security's price never reaches the specified limit price.

A trailing stop loss is a slightly more complicated version of the stop loss order in which the stop loss prices set at a fixed percentage or value below the market price. If the market price rises, the stop loss price rises proportionately, but if the share price falls, the stop loss price doesn't change. That method allows the investor to set a limit on the maximum possible loss without setting a limit on the maximum possible gain, and without requiring paying attention to their investment on an ongoing basis.

A trailing stop order is similar, but based upon the stop limit order. With a trailing stop limit, once the price drops below the stop, a limit order is executed with the limit price equal to the final stock price.

The difference between the two is that the order executed with the trailing stop loss is a market order. If the share price continues to fall after the stop price is reached, but before the shares are sold, they can be sold at a lower price than the stop price. With a trailing stop limit, the shares will not be sold at less than the stop price (but with any limit order, it is possible that the limit price will never be reached).

## Trailing-Stop Order

A trailing-stop order is an order entered with the stop perimeter that creates a moving or trailing activation price, hence the name. This parameter is entered as a percentage change or actual specific amount of rise (or fall) in the security price.

Here's the example explaining how trailing-stop limit losses work:
Example: You're long 100 shares of XYZ with the current market price of $\$ 10.00$. You set up trailing stop limit sell order with these perimeters:

| Trail Amount $=1$ |
| :--- |
| Stop Price $=\$ 9.50$ |
| Limit Price $=\$ 9.45$ |

Your trailing stop order calculates a limit price "Delta" using:
Stop Price - Limit Price $=.05$
The market price rises to $\$ 12.00$; now your trailing stop price has risen to $\$ 11.00$, and your limit price is at $\$ 10.95$. The price drops to $\$ 11$, and your limit order for $\$ 10.95$ is submitted.

I hope that wasn't too technical for you. Basically what we did to keep it simple for AT\&T is to put in the "stop loss" at $\$ 6.00$ when the price was $\$ 6.90$. That stop-loss order is only good for 60 or 90 days (brokers don't like keeping long-term stop or limit orders on the books - too complicated). What our stop loss order means is that our broker will sell those 17 contracts at $\$ 600$ a contract or $17 \mathrm{X} \$ 600$ equals $\$ 10,200$. We have protected our profits. And we can copy the trailing stop loss. Say AT\&T goes to $\$ 10.00$ on April 5, 2007 - we can cancel our stop loss at $\$ 6.00$ a share and put in the new one at $\$ 9.00$ a share. Then if AT\&T slips from $\$ 10.00$ to $\$ 9.00$, the broker will sell our LEAPs contracts at $\$ 900$ a contract or 17 contracts $\mathrm{X} \$ 900$ equals $\$ 15,300$. Pretty neat way to protect profits!

## Chapter 22

## How to Use LEAPs in a Severe Bear Market

It's now the end of January 2008. The stock market has had a pretty severe bear market for the past half year or more. And this bear market has severely affected our model LEAP portfolio. I have found that LEAPs react quite severely in a bear market. Also LEAPs react quite strongly when a stock becomes a dog that isn't going to recover. Based on actual real world experience, I am writing this chapter to see what we can do about severe bear markets that will improve the performance of our LEAPs. Also what can we do to prevent ourselves from being stuck with the dog that offers little or no hope of a recovery. I will start off by showing you two examples of what we want to prevent. Below are the spreadsheets again in the Adobe Acrobat free version showing how Advanced Micro Devices (AMD) and Starbucks have done in the current bear market.

You can see that both AMD and Starbuck's LEAPs have been big losers. Now we want to prevent ourselves from getting hurt at by future AMDs and Starbucks. How can we do that?
The first thing to think about is should we have bought AMD and Starbucks in the first place? With the benefit of hindsight, I think we should not have bought AMD. AMD has always been volatile and frankly computer chips are not a hot business right now when I wrote this. Even Intel hasn't done that well lately or when I wrote this 15 years ago. Frankly I thought Starbucks was a good buy when bought. It was down and to me prospects for the future look good. BUT if we had held onto AMD and Starbucks and rolled over the LEAPs to longer-term LEAPs we would have made a lot of money - again be patient and in this for the long haul. So we have to acknowledge we will make mistakes in these high risk areas. But we can minimize them and hang in there till things get better. Basically we got to buy time for our LEAP to get better.

But since I am editing this several years later if we had the courage to help hang onto the Starbucks LEAPs we would've made a ton of money. Like a told you earlier; go to Yahoo Finance and do historical prices on Starbucks say from January 2008 to the present and see how much up-anddown action you got and the stock didn't gain or lose nearly as much as the LEAP did. That's why if you're only buying a few LEAPs, stick to the "blue chip" LEAPs like the ones I now featured my newsletter. Again we all know what level of risk we can handle and if you can handle a LEAP like Starbucks going up and down like it did you will make a great deal of money if you are patient. And the same thing happen with Crocs, a unique type of Shoe Company that went all the way down from say $\$ 22$ to $\$ 1$ and is and then went back up into the $\$ 30$ s. See the attached spreadsheet for Crocs in Chapter 25 of Adobe Acrobat free book to see just how powerful AIM is if you hang in there!

In reviewing how I handle AMD and Starbucks, I find I wasn't aggressive enough in waiting to buy when the price of the LEAP went down. I just wasn't aware that LEAPs could sink so far in a bear market. In the future when you own a LEAP, you must really analyze when to buy and how much to buy. In the future I will take a much stronger stands and will wait to buy initially in the down market. A good rule of thumb would be to wait until your LEAP drops $50 \%$ before making your first buy. So for example if you bought a LEAP that was $\$ 4$ a share or $\$ 400$ a contract then you wait until the LEAP drops to $\$ 2$ a LEAP or $\$ 200$ a contract and then you make your first buy. And also use an aggressive bear SAFE to make a minimum buy of around $\$ 1,000$ worth of new LEAP shares or even less.

You'll see looking at AMD that it was originally bought at $\$ 3.45$ a share. This was a low price at the time comparing the LEAPs high/low history. But as hindsight shows, we bought new shares too
soon. The first buy was made at $\$ 2.70$ and following the history of AMD, you will see many other buys were made too soon. Since AMD was a risky LEAP, I should've waited until it dropped the $50 \%$ before making the first buy or set up an automated sell order at say $50 \%$ of the initial price. You can see that by not doing that we set ourselves up for a big loss that has very little chance of ever being recovered in the short term but a good chance to be recovered over the long-term.

Based on my experiences with AMB and Starbucks, I decided that you should limit yourself to "blue chip" LEAPs initially or really understand how volatile a non-blue-chip could be before you purchase it as an initial LEAP in your portfolio and be able to handle the emotional and financial risks. Even if you buy a conservative LEAP, that doesn't mean you will eliminate the risk entirely. The nature of the beast is that a LEAP will always be a lot more volatile than the stock it derives its value from. Even on very conservative stocks, LEAPs can fall sharply. Take a look at Citigroup: again you will find this spreadsheet in your Adobe Acrobat version.

As you can see Citigroup has fallen quite sharply but not as bad as either Starbucks or AMD. I have hope for Citigroup (boy was that hope misplaced, several years after writing this Citigroup has basically become a penny stock and shows no signs of ever recovering even close to what it originally was). I always think they will rise but that is not always true.

Remember my cardinal rule for investing - buy at or near the 52-week low. But even with that strategy, you can't guarantee that you will buy at the absolute bottom. So even with the "conservative" LEAPs, you run the chance of a sharp drop before the LEAP recovers. Again be cautious on when to make the buys and be cautious on how much you buy. When you see that $75 \%$ S above in the REMARKS column, it means that instead of a 10\% SAFE (or $10 \%$ of the SHARE VALUE) I used a $75 \%$ S (or I used 7.5 times the amount of the $10 \%$ SAFE or I used $75 \%$ of the SHARE VALUE price for the SAFE amount.

Thus in the example above which you'll find somewhere in that spreadsheet PORTFOLIO CONTROL $\$ 19,160-$ SHARE VALUE $\$ 10,440=\$ 8,720-75 \%$ SAFE $\$ 7,830=$ about $\$ 1,000$ worth of new LEAPs to buy. Thus I only bought $\$ 1,160$ worth of new LEAPs at $\$ 2.90$ a LEAP or bought 4 more contracts. I wanted to be very cautious in case Citigroup went down further. As you can see from the spreadsheet Citigroup did go down further. But I feel a small buy at $\$ 2.90$ was still warranted because we don't know what the bottom will be and $\$ 2.90$ to me is still a good price to buy some more Citigroup LEAPs at.

I am also changing the initial CASH/LEAP ratio I recommended for LEAPs. Let's be conservative in the future and go 50\% CASH and $50 \%$ LEAPs instead of $2 / 3$ LEAPs and $1 / 3$ CASH. It will be better to have that extra cash to make buys with.

So let's summarize the advice I'm giving you for LEAPs in bear markets:

1. Analyze the parent stock very closely before buying the LEAP. Have a look at historical prices in Yahoo Finance. Stick with more conservative, blue-chip stocks in the beginning until you get experienced with LEAPS. They can still be risky but will offer greater upside potentials when the market goes back to the bull.
2. Don't make the first buy until the LEAP price has dropped $50 \%$ from what you initially bought it at. Make future buys using high bear SAFE amounts like I talked about above. Try to keep your actual buys around $\$ 1,000$ saving your CASH for future buys if the LEAP goes lower.
3. Start with $50 \%$ CASH, $50 \%$ LEAP ratio. Better to be more conservative and have more CASH for buys.
4. Ignore small changes both up and down. When we buy a LEAP in a bear market, we are expecting a big decrease sometime in the short-term, two years until the LEAP expires.

Thus we don't want to buy or sell too quickly but rather get more LEAPs as cheaply as possible and sell those LEAPs for good profits from the parent stock recovers from whatever drove down. We must be patient.
5. It's best to start with say 10 LEAPs (if you're a big risk taker type of investor) so we can have a variety. But in a bear market, most if not all of your LEAPs could go down from your initial purchase price even though you bought them thinking all the bad news was out. A way to prevent is to mix call LEAPs with put LEAPs - then some will go up and some will go down. Look at how Citibank sank after its initial bad news. It still had more bad news and the market reacted to that bad news and drove the stock and LEAP even lower. That's why the $50 \%$ initial CASH is a good idea - use that extra cash and maximize our bear strategy for buys will leave us with the best chance of maximizing our cash to make cheap buys. Remember at some point the stock and LEAP will start going up and staying up. But not for all stocks and LEAPs.
6. Here's another trick I learned since I originally wrote this. Remember how I said that it LEAP will expire like it will expire in January of any given year. But really any LEAP you own never has to expire because you can always roll it over to the LEAP in the following year so for example if you own a January 13 LEAP, you can always roll it over to a January 14 LEAP and buy an extra year of time.
7. Another great idea as I edit this. You are not limited to only buying call LEAPs (make money when stock goes up). You can also buy put LEAPs (make money when stock goes down.) I have come up with a great way of implementing both a call/put strategy using LEAPs on ETFs. You'll get a free bonus explaining that strategy when you buy my e-book

This is not the perfect answer to LEAPs in a severe bear market but it offers you good ideas to increase profits with LEAPs in a bear market. If you have any other good ideas for improving this chapter I'd love to hear them. E-mail your ideas to me at jeffee13@hotmail.com

## Chapter 23 <br> Using ETF's with AIM

Electronically Traded Funds (ETF's) are a simple but brilliant idea. Each ETF is a basket of stocks like an open mutual fund but trades like a stock and closed-end fund. You can buy or sell an ETF through your broker anytime just like a stock. You can also do things with ETF's that you can't do with mutual funds - short them, put in limit orders and buy or sell them any time without waiting for the end of the day like with mutual funds.

Shares of ETF's are traded with other buyers and sellers. If you want to buy, there's another investor who wants to sell and vice versa. Basically the price you see is the agreed to price for both buying and selling. There is a bid and ask range but usually it's only a couple of cents and not worth worrying about. You will see another excellent way I recommend to play ETF's with AIM in one of the free bonuses I will e-mail you after you give me your e-mail address after buying my e-book.

I will only touch on the basics of ETF's and then get into the nitty-gritty of using them with AIM. There are two excellent books that will tell you everything you want to know about ETF's. The first book is The ETF Book by Richard A. Ferri. The second book is Investing with ExchangeTraded Funds Made Easy by Marvin Appel. Read these two books to get a good overview of ETF's.

## Use Limit Orders with ETF's, Stocks, Closed-End Funds and LEAPs

We all know that the stock market is in a free-fall as of October 10, 2008 when I'm writing this. We also know the prices for ETF's and other investments could go lower. So when do we buy? Do we buy now? Do we wait? Well, we can have the best of both worlds. We can buy now but put in a limit order. That means if we like an ETF like iShares FTSE/Xinhua China 25 Index Fund - FXI, here's what I recommend you do.

You can easily get the current 52 -week high, low and current prices by going to Yahoo Finance or the New York Stock Exchange website which is http.//www.nyse.com and typing in the ETF symbol box in the quote box at the top of the page. As of October 9, 2008 checking FXI tells us the following: 52-week high - \$73.19; 52-week low - $\$ 26$; current price $\$ 26$. Well that certainly meets my definition of buying at or near the 52 -week low. But can I do even better than buying at the 52-week low? Yes I can.

My instincts and readings tell me we will have a continuing downturn for anywhere from 3 to 6 months. Now is still a good time to buy. So what do we do? Well, I realize that ETF's are not as volatile as a stocks or LEAPs which is good if I am not an extreme risk taker. But still ETF's are volatile enough for AIM - all the ones you'll see listed here have very good high/low spreads - most over $100 \%$.

So here's what I do with FXI and other ETF's and other investments I want to buy now. I put in a limit order with my broker. It's very simple to do and a limit order stays on the books for I believe 90 days. So for FXI, I see the current price is $\$ 26$. I can place a buy order with my broker at say $\$ 23$ or $\$ 21$ or even lower and wait to see if the price drops enough for my buy to be made..

You will see many ETFs suffered the same fate in this bear market - they are all at or near their 52week lows. Basically when you buy an index ETF you are betting on the direction of the market. Buying these ETFs is like buying the indexes and the stock itself. Going down and start going up. You're betting that the market will soon swing from bear to neutral and then to a bull market By putting in the limit order you don't have to worry about watching the stock ticker all day so you don't miss buying at the lower price you want to buy at. Using limit orders is very good strategy for making more money when the bull market finally comes around. And it will!

The Dow actually dipped to about 6,500 before it rebounded and currently it is that about 12,000 so you see AIM would've made you good profits on ETF's if you had bought on the way down to 6,500 and eventually you would've gotten some sells on the way back up to 12,000 .

## Types of ETF's I Recommend

After reading Richard A. Ferri's book, The ETF Book, I was convinced to buy ETF's that are mirror images of established indexes, buy ETF's related to countries, buy ETF's related to industries, and buy ETF's related to Real Estate Investment Trusts (REITs). These are considered passive ETF's which means there is no fund manager making the decision. The ETF mirrors the index it tracks, so theoretically if the Dow Jones Industrial Average goes up 5\%; your ETF tracking the Dow Jones Average goes up 5\%. Vice versa, if the Dow Jones Average goes down 5\%, then ETF goes down 5\%.

I think you see from the below sample of large index ETF's (again you will find several spreadsheets listing these ETF's in your free Adobe Acrobat version of my investing book) that they are all down at or near their 52-week lows just like their big brothers the indexes themselves at the time I wrote
this).. When the indexes go back up, the ETF will go back up. Take a look at the sample of index funds listed below. You'll see the vital info on them including the 52 -week highs, lows, current price and yields. These index ETF's don't pay large dividends like the REIT ETF's you'll see a little further down in this chapter.

On the next page you'll see a sample of index ETFs. You will see they have all suffered the same fate in this bear market - they are all at or near their 52-week lows. Basically when you buy an index ETF you're betting on the direction of the stock market itself. Buying these ETFs is a bet that the indexes and stock itself will stop going down and start going up. You're betting that the market will soon swing from bear to neutral and then to a bull market. Remember that life and stock markets go in cycles. At the bottom of the Great Depression in 1931, the Dow Jones Industrial Average hit its all-time low of 31. Even with this bad bear market, it's still around 8,200. And I don't think it will go that much lower before it starts turning around. With the benefit of hindsight as I rewrite this in 2011 we know that the Dow Jones Average went down to around 6,500 and has since rebounded and is now around 12,000 .

I will also give you examples of global, industry, and REIT ETF's and you will see they look pretty similar to the index ETF's. I think ETF's are an excellent way to invest in a severe bear market because they are conservative, are balanced among many stocks, pay good dividends for the most part, and have good high/low swings. Look over the different spreadsheets I think you'll see ETF's can play an important part in your AIM portfolio.

## Chapter 24

## Right Ratio for Shares and Cash

Robert Lichello, the inventor of the AIM system, originally came out with the idea of using 50\% cash and $50 \%$ shares when you start an AIM investment. So for example if you're investing \$10,000 into a stock you would start with $\$ 5,000$ worth of cash and $\$ 5,000$ worth of stock.

I went along with the $50-50$ split for many years until I finally encountered a severe bear market around the year 2000. When you have a severe bear market your cash ratio can go down substantially. And if you look in Chapter 12 of my book, and look at how Campbell Resources did for 3 years you will see that you might need very deep pockets to come up with additional cash that AIM calls for if you started with the 50-50 arrangement and also you are using the $10 \%$ SAFE amount to determine buys and sells.

Since I have been playing with AIM for many years I have done considerable thinking on good ways to tweak the game to help you make maximum profits. And one way you can make additional profits is by the wise use of the ratio of shares and cash.

Different kinds of investments call for different kinds of ratios between the share amount and the cash amount. I'll give you some examples below so that you have a better idea of what I am talking about.

## Closed-End Fund

A closed-end fund is a special type of mutual fund. The biggest difference between a closed-end fund and a regular mutual fund is the fact that a regular mutual fund can constantly add to the fund as new investors put money into the fund. For example Fidelity Magellan many years ago was considered one of the top mutual funds in the United States. It grew and grew from a small amount to I believe over $\$ 5$ billion. Basically all mutual funds are open which means they can continue to grow as new investors put money in. But also they can shrink if mutual fund investors start taking their money out of the fund.

I have never liked regular mutual funds to use for AIM investing because of many restrictions on buying and selling and many fees and I always felt that closed-end investments were a better way to use AIM than open mutual funds were.

Here's a quick way to explain what a closed-end fund is. Somebody decides on an objective for a closed-end fund for example they could represent all the good companies in Brazil, China, or it could be designed to bring in high levels of dividends - there are many different objectives you'll find with a closed-end fund.

The nice thing about closed-end funds is this. And I would use as an example one that I have recommended in the past and still recommend called HYF. Let me explain how the mutual fund is set up and works and why it is good for AIM investing.

When a fund like HYF is set up, they issue let's say for example 10 million shares at $\$ 10$ each. The shares are issued just like shares in a stock. So these 10 million shares are bought by investors and the closed-end fund gets listed on one of the stock exchanges normally the New York Stock Exchange. Once the 10 million shares are sold, the only way for a new investor to buy shares in that closed-end fund is to buy shares on a stock exchange from somebody who owns the shares. Basically just the same way you would buy shares of stock you traded on the stock market and you buy somebody else's sells.

The advantage is now that a closed-end fund trades on the stock exchange you can buy and sell instantly you don't have to wait for the end of the day and for the net asset value to be determined. Also closed-end funds are much more likely to have better highs and lows than regular mutual funds. And closed-end funds are just as conservative as an open mutual funds but without any of the drawbacks.

Let's go back to our example of HYF. This is a great closed-end fund for investors that are looking for a monthly dividend and a high monthly dividend to boot and also a little up-and-down action using AIM at the same time. This fund is at a very low price and in the last year the high was around $\$ 2.66$ and the low was $\$ 1.83$. And HYF pays a dividend of a little over $10 \%$ a year.

If you look at how it traded in the last year you will see that I was way too conservative for one of my investors in Houston who started with $\$ 20,000$ in HYF because he wanted to have a high income monthly dividend on one of his investments. I started him out with $\$ 10,000$ worth of cash and $\$ 10,000$ worth of shares in HYF. He bought his initial shares in August of 2011 and with his $\$ 10,000$ he was able to buy 5,000 shares at $\$ 2.12$ or he originally bought $\$ 10,600$ worth of HYF. Again investing is an art and not a science so we don't have to buy exactly $\$ 10,000$ worth of shares so I set up a spreadsheet to show $\$ 10,600$ worth of shares of HYF and $\$ 9,400$ worth of cash in HYF so again he started off with a round some of $\$ 20,000$.

Since the original buy in August 2011, the only AIM action he has had was one buy that I recommended to him that actually didn't exceed the AIM threshold for a buy but HYF was at a 52week low so I thought it was a good idea to buy more shares of HYF and I had him buy 200 more shares at $\$ 1.83$ so he grew from 5,000 shares to 5,200 shares.

Remember he started off with $\$ 9,400$ worth of cash in August 2011. This investors called me yesterday and we were having a very nice chat about AIM and I got to thinking about the ratios between cash and shares of the investment because my investor brought up the subject.

He was asking me if I thought it was a better idea to use two thirds of the money to buy the shares or the stock or the closed-end fund or the LEAP and one third to put into cash. If an investor started with $\$ 21,000$, then what my investor was suggesting was let's use $\$ 14,000$ of that $\$ 21,000$ to buy shares in the stock, closed-end fund, LEAP, and put the other $\$ 7,000$ into cash.

I told him that for about the first 10 years I was using AIM I always recommended blindly to use two thirds shares and one third for cash. But that was before the great bear market of 2000, 2001, 2002. Then I worked on developing bear strategies to help investors conserve their cash when the market was in a severe bear turn and everything was going down.

The first thing I did was to return to Robert Lichello's original concept of 50\% cash and 50\% stock. But as you will see in Chapter 12 of my book, Why the System Works, you will see that just using the $50 \%$ cash and share ratio will not prevent the depletion of your cash when your investment has a severe bear turn. But if you have deep pockets the best system to use is the $50 \%$ cash $50 \%$ stock ratio and I'll explain it to you quickly.

Campbell Resources started off around $\$ 6.40$ and about two years later was selling for $\$ .85$. Naturally AIM was gobbling up lots of cheap shares as Campbell Resources went down and down. For that example I used the mythical starting $\$ 10,000$ that was split into 5,000 CASH and 5,000 SHARE VALUE.

When you look at the spreadsheets in Chapter 12 you will see that you had to put in an additional $\$ 25,000$ worth of cash to make all of the buys that AIM told you to make as Campbell Resources went down and down. There was a three month stretch when Campbell Resources was selling below $\$ 1.00$ and AIM just gobbled up lots of cheap shares buying over 1,000 shares in each of those three months at extremely cheap prices.

But faithfully following AIM with the $10 \%$ buy amount and the $10 \%$ sell amount that Robert Lichello recommended, you eventually finished with a profit of $38 \%$ despite the fact that Campbell Resources finished down $62 \%$ after the three years.

So putting in all that additional money did pay off in the long run but not everybody has deep pockets and can put in additional cash when AIM calls for it. I realized that so I said I have to guide my AIM strategy to be more conservative and try and save cash as an investment goes steadily down.

As I was talking to my investor, it suddenly occurred to me that we could use different ratios depending on the different types of investments that he owns. He is invested into 3 LEAPs (a longterm option investment that expires in January of every any given year, so for example now you have LEAPs that expire in January 2013 and January 2014.) He owns like I said the one closed-end fund HYF and another ETF or electronically traded fund with the symbol BOE. He also owns a very aggressive ETF from Direxion called the China Bull (YINN) (3X) leveraged that follows the Chinese market. This fund is leveraged so if the Chinese stock market or the Dow Jones Industrial Average for example goes up $3 \%$, this fund with the symbol YINN would go up $9 \%$.

When I talked to him yesterday he got me thinking about the ratios between cash and stock or shares and I decided to tell him that with the conservative closed-end fund HYF he did not really need to have a $50 \%$ cash and $50 \%$ share ratio. Like I said earlier he's owned HYF since August 2011 and since August 2011 his CASH account on that closed-end fund has gone from \$9,400 down to $\$ 9,034$ because we bought the 200 shares in October at the 52 week low of $\$ 1.83$.

I told him right on the phone that HYF is a great dividend payer and the $\$ 9,000$ in the CASH account with his broker in the money market is paying virtually $0 \%$ interest. I told him we could be more aggressive owning shares in HYF and right off the top of my head I recommended on Monday he buy another 1,000 shares at the market price of $\$ 2.16$. He just doesn't need to have $\$ 9,000$ worth of cash sitting with his broker earning no interest when this investment is very conservative, HYF will never need a very large amount of cash to make additional buys in the future. It's just a different kind of investment so now I'm going to be more aggressive on conservative investments and recommend to my investors that they put more money into shares and less money into cash.

He has another closed-end fund with the symbol BOE and I'm also going to check that one out and recommend to him that he put more money into shares and less money into cash.

## Stocks

Stocks are mixed bag. There are some stocks that are very conservative and then there are some stocks that can have pretty wild swings. In my original book I Guarantee You Will Buy Low Sell High and Make Money, I identified the two types of stocks - conservative stocks and semiaggressive stocks. Conservative stocks to me are more like the traditional 30 stocks you find in the Dow Jones Industrial Average stocks that are have big names that are basically household words like AT\&T, IBM, Boeing, General Electric, American Express, etc.

Semi-aggressive stocks on the other hand have wilder high/low swings; you can find stocks that might have a low of $\$ 3$ and a high of $\$ 30$. You would want to keep a 50-50 ratio for stocks that do have wild swings but you really could decrease the amount of cash in stocks that are conservative. I can't really make a blanket statement on any stock but from now on in the future with my investors I will definitely advise them that I think you could have less cash sitting in in your brokers money market account because of the type of stock or closed-end fund or ETF that you own.

## LEAPs

LEAPs, like I said earlier, are long-term options on either a stock or ETF. Even LEAPs on very conservative stocks such as American Express, General Electric, IBM, can be extremely volatile. I would always recommend a blanket rule to keep $50 \%$ CASH and $50 \%$ LEAPs anytime you buy LEAPs. I even have a basic rule that you'll see in my other book that I don't even consider buying more LEAPs for one of my clients until the LEAP has gone down at least $50 \%$. That means for example if we bought a LEAP at $\$ 4$ or $\$ 400$ for one contract as you have to buy contracts with LEAPs you cannot just buy 25 LEAPs, then I would wait until the LEAP went from $\$ 4$ to $\$ 2$ and then I would advise my client we should buy some more contracts.

I think LEAPs should be in everybody's portfolio because they pay a much higher rate over the long term than the underlying derivative or stock or ETF that they follow. LEAPs are as safe as the stock or ETF that you buy them on. And you can always roll over LEAPs from one year to the next so really they would be indefinite not expiring; like most people think that they are only an expiring investment that's not really true.

## ETF's

ETF's are recent invention and have really only been around for about the last couple years. And I think there are a great new invention to the world of investing. ETFs have all the advantages that closed-end funds have which means they trade on the stock market and you can instantly buy and sell them and they give you an expanded range into many different types of investments including some from Direxion and others that are leveraged which means they can go up and down at faster rate than non-leveraged ETF's. And to compound the felony, you can even get LEAPs on some ETF's I'll talk about that in another chapter.

With most ETF's I do not feel you need to have $50 \%$ cash and $50 \%$ ETF ratio when you initially start with the investment. Any investment that is a combination of other investments is always going to be safer than if you buy one stock or one or one LEAP. It's just the nature of the beast that something that is a collection of things can never be affected greatly by anyone of the multiple investments that is in the fund or the ETF. Also both closed-end funds and ETF's have management that went into the creation of and sometimes the continuing evolution of the ETF into the future. So you are actually getting a little bit of management when you own an ETF or a closed-end fund. So you can afford to be more aggressive owning shares in the fund or the ETF and have less CASH on your spreadsheet for that particular investment.

I want to emphasize that one size does not fit all when it comes to investing and that's why I think it helps you to have somebody like me advising you on how much CASH and how many shares should be in the ratio for any particular investment that you thinking of owning.

Some investors are very conservative, some investors want some income, some investors want to go for larger returns; maybe they're older in life and they don't have a lot of time to sit there and wait 20-30 years for their investments to make them lots of money and that's fine. AIM can handle any type of investor from the most conservative to the most risky. And again AIM will faithfully tell you exactly how much to buy, how much to sell, or to do nothing.

And the other beauty of AIM is that you can decide if you have me manage it for you. That means you will have me looking at your investments on a daily basis and advising you whether to sell whether to buy or whether to do nothing. It's always better to actively manage investments than just buy them and forget them.

So I hope this helped you decide and give you a little information at least on the questions to ask when you start investing in AIM about how to maximize your profits with the minimal risk.

## Chapter 25

## How to Find Investments to Consider

As you read in my first investing book I have 10 cardinal rules of investing that I feel help you make the most profits on your investments. And rule number one is one that should be your starting point when you're considering investments to buy at any particular point in time.

And that basic rule is to only consider investments that are at or near their 52 -week lows. And it is very easy to find investments at their 52 -week lows in several different ways. The basic way I find investments at or near their 52-week low is the old-fashioned way of looking at all stocks on the New York Stock Exchange and the NASDAQ stock exchange and seeing which stocks, ETF's, closed-end funds that are at or near their 52-week lows

Investments at their 52-week lows should be your starting point before you apply any other criteria to them. Some of the other basic criteria I do apply to an investment is I like one in a solid company, that shows revenue growth, EPS growth and large trading volumes, typically I like to look for ones that trade is least 10 million shares a week.

And of course with any investment that is at or near its 52 -week low, I want to see some volatility. So basically I will only look and consider investments that are at their 52-week lows only if the investment shows a 52 -week high low difference of at least $100 \%$. So for example if I find the stock that has a high of 15 a low of 5 and is currently trading at 6 that would be one I would consider.

There are many fine tracking tools such as Value Line, Yahoo financial analysis, where you can plug in various factors and narrow down the general list into a few choices. I don't basically do that mainly because I grew up without computers and so I don't find that the most friendly way to do it and I basically like the old-fashioned approach of looking at them considering them and then deciding if him and put him on my monthly newsletter of investments I am recommending for the month.

I basically marry the old way with the new way because even though I'm letting my eyeballs look at all these stocks I am also doing it on a computer. The best place to me to find all of the information

I'm talking to you about above like the 52-week highs and lows, the trading volume, whether the EPS is going up is in the Barrons stock tables.

You can find the Barron stock tables very easily at the bottom of their webpage, http://www.barrons.com

Here's what I do every month so you could do the same thing if you want to. Actually rather than doing that I would recommend you become a subscriber to my newsletter is only $\$ 15$ the year and let me do it for you (and remember your first-year of my newsletter FREE!

I go down to the bottom of the Barron's website and I find stock tables hot link in blue area way at the bottom. Then I click on the stock tables and then the page comes up that shows the New York Stock Exchange and the NASDAQ Stock Exchange and I believe the American Stock Exchange.

Underneath the New York Stock Exchange and the NASDAQ Stock Exchange you will see hot links to the entire alphabet from A to Z. I click on the A on the New York Stock Exchange and look at all of the stocks that start with A that comes up on the screen with lots of other good information including their 52-week highs and lows, the percent of dividend they pay if any, and the EPS for about three years, and the trading volume (typically I look for investments trading at least $10,000,000$ shares a week)..

That gives me enough information to decide ones that I would consider good buy candidates as I say in my newsletter. Doesn't mean that's the end of it but it's a good starting point and basically what I recommend after you've decided on a couple that you like is go to your stockbroker's website, the one I always use is TD Ameritrade and you'll find when you do research on stocks and other investments that it's very easy to find lots of additional information.

I highly recommend the S\&P Reports that follow a definite format and give you tons of information about any stock that you could ever want to buy. All you have to do once you've put the stock symbol that you want to research into the TD Ameritrade website is scroll down and you'll see the S \& P Reports and other reports such as Zach's and they'll even give you a quick ranking show you what they think of the stock. S \& P uses one to five stars with five stars being the highest rated stock.

I don't just blindly go by the number of stars that S \& P uses but it is one of the things I will consider. Many times ranking services may downgrade a stock because most research reports are geared to a very short-term period of time. If you can take the long range view you can find many bargains that even analysts are rating low because they don't expect them to do well in the immediate short-term but if you take the view how will they do in the long term you can make a lot of money.

Let me give you another way to check on a stock for the long term so you can get the historical perspective that you need and realizing that history does repeat itself you will feel less wary of looking at the short term prescribed specs of the various stock and you will see that many stocks have risen from the dead and made investors tons of money if they were patient.

Here's the perfect stock to check out and once you see how it did you will be amazed and you will see how using AIM you could have made a ton of money off of the stock. The stock I'm talking about is Crocs which has the symbol CROX. A quick rule of thumb is that if you see a stock with a three letter symbol it is on the New York Stock Exchange and if you see a stock with a four letter symbol it is on the NASDAQ Exchange.

Here's the quick way you can check the history of the stock by checking the monthly prices for say three or four years to see how that particular stock bid over a long period of time. You go to the website - http://www.yahoo.com

When you get to the Yahoo website look on the left-hand side and you will see Finance. Click on Finance. After you click on Finance and the Finance Yahoo website opens up, you will see at the top a little white CGI box that says "Get Quote". And all have to do is type in the symbol for the stock or ETF which in this case is the symbol CROX and then the summary page for that stock will appear on your computer screen.

The summary screen gives you lots of good information about the stock including the 52 -week highs and lows the current selling price of the stock, target price for the year which is basically what analysts think the stock of the selling out within the next year and whether the stock pays dividends and the average daily trading volume a wealth of information.

But like I used to tell investors in my classes the key to making profits is what the price of the stock does, not what they actually make, not any fundamentals, not the industry it's in but what does the price do? Is it a volatile stock that tends to be a roller coaster stock which means it goes up goes,
down, goes up, goes down, because on all of those down trips you gonna be buying and all of those up trips you gonna be selling and that is the way you make a ton of money.

Okay now you're on the home summary page for Crocs on Yahoo Finance website. If you look on the left you will see a hot link to historical prices. Click on that. You will see that you can check daily, weekly, monthly, or any dividends that the stock or other investment has paid for any length of time that you want. So look at the two dates - the starting and ending date - and pick an appropriate starting date to check the price history.

I recommend you check the monthly stock price for say 4 or 5 years of the stock if the company has been around that long. That will give you a much better indication of how well you can do with a particular stock using AIM over the long-term. Because I always emphasize in my teaching classes and to any investors I have that you have to think of AIM as a long-term investment not a short-term investment. That's not saying you can't make some good profits in the short term but take a longterm view and you will not be disappointed.

Well I will spoil the suspense a little and tell you when you look at the monthly prices for the symbol CROX you will find a great roller coaster. You will find this the stock went from like the $\$ 30$ price range down to the $\$ 1$ price range back up to the $\$ 17-\$ 20$ price range off and on over those 4 or 5 years.

Look at it and you will see the perfect kind of AIM stock that I recommend.

It's been a pleasure writing this for you and finally after 15 years I have upgraded the book and that is thanks to Dragon NaturallySpeaking voice recognition software. Now the book meets my high standards because you deserve the best. I wish you all the best in investing and always remember you have any questions or I can help you please e-mail me at jeffee13@hotmail.com

Crocs Shoes - CROX from February 2006 to October 2011 using AIM $10 \%$ SAFE
