

STUDIES IN THE PSYCHOLOGY OF SEX, VOLUME V

Erotic Symbolism
The Mechanism of Detumescence
The Psychic State in Pregnancy

By HAVELOCK ELLIS

1927

PREFACE.

In this volume the terminal phenomena of the sexual process are discussed, before an attempt is finally made, in the concluding volume, to consider the bearings of the psychology of sex on that part of morals which may be called "social hygiene."

Under "Erotic Symbolism" I include practically all the aberrations of the sexual instinct, although some of these have seemed of sufficient importance for separate discussion in previous volumes. It is highly probable that many readers will consider that the name scarcely suffices to cover manifestations so numerous and so varied. The term "sexual equivalents" will seem preferable to some. While, however, it may be fully admitted that these perversions are "sexual equivalents"--or at all events equivalents of the normal sexual impulse--that term is merely a descriptive label which tells us nothing of the

phenomena. "Sexual Symbolism" gives us the key to the process, the key that makes all these perversions intelligible. In all of them--very clearly in some, as in shoe-fetichism; more obscurely in others, as in exhibitionism--it has come about by causes congenital, acquired, or both, that some object or class of objects, some act or group of acts, has acquired a dynamic power over the psycho-physical mechanism of the sexual process, deflecting it from its normal adjustment to the whole of a beloved person of the opposite sex. There has been a transmutation of values, and certain objects, certain acts, have acquired an emotional value which for the normal person they do not possess. Such objects and acts are properly, it seems to me, termed symbols, and that term embodies the only justification that in most cases these manifestations can legitimately claim.

"The Mechanism of Detumescence" brings us at last to the final climax for which the earlier and more prolonged stage of tumescence, which has occupied us so often in these Studies, is the elaborate preliminary.

"The art of love," a clever woman novelist has written, "is the art of preparation." That "preparation" is, on the physiological side, the production of tumescence, and all courtship is concerned in building up tumescence. But the final conjugation of two individuals in an explosion of detumescence, thus slowly brought about, though it is largely an involuntary act, is still not without its psychological implications and consequences; and it is therefore a matter for regret that so little is

yet known about it. The one physiological act in which two individuals are lifted out of all ends that center in self and become the instrument of those higher forces which fashion the species, can never be an act to be slurred over as trivial or unworthy of study.

In the brief study of "The Psychic State in Pregnancy" we at last touch the point at which the whole complex process of sex reaches its goal. A woman with a child in her womb is the everlasting miracle which all the romance of love, all the cunning devices of tumescence and detumescence, have been invented to make manifest. The psychic state of the woman who thus occupies the supreme position which life has to offer cannot fail to be of exceeding interest from many points of view, and not least because the maternal instinct is one of the elements even of love between the sexes. But the psychology of pregnancy is full of involved problems, and here again, as so often in the wide field we have traversed, we stand at the threshold of a door it is not yet given us to pass.

HAVELOCK ELLIS.

CONTENTS.

EROTIC SYMBOLISM.

I.

The Definition of Erotic Symbolism. Symbolism of Act and

Symbolism of
Object. Erotic Fetichism. Wide Extension of the Symbols
of Sex. The
Immense Variety of Possible Erotic Fetiches. The Normal
Foundations of
Erotic Symbolism. Classification of the Phenomena. The
Tendency to
Idealize the Defects of a Beloved Person. Stendhal's
"Crystallization".

II.

Foot-fetichism and Shoe-fetichism. Wide Prevalence and
Normal Basis.
Restif de la Bretonne. The Foot a Normal Focus of Sexual
Attraction Among
Some Peoples. The Chinese, Greeks, Romans, Spaniards,
etc. The Congenital
Predisposition in Erotic Symbolism. The Influence of
Early Association and
Emotional Shock. Shoe-fetichism in Relation to
Masochism. The Two
Phenomena Independent Though Allied. The Desire to be
Trodden On. The
Fascination of Physical Constraint. The Symbolism of
Self-inflicted Pain.
The Dynamic Element in Erotic Symbolism. The Symbolism
of Garments.

III.

Scatalogic Symbolism. Urolagnia. Coprolagnia. The
Ascetic Attitude Towards
the Flesh. Normal Basis of Scatalogic Symbolism.
Scatalogic Conceptions
Among Primitive Peoples. Urine as a Primitive Holy
Water. Sacredness of
Animal Excreta. Scatology in Folk-lore. The Obscene as
Derived from the
Mythological. The Immature Sexual Impulse Tends to
Manifest Itself in
Scatalogic Forms. The Basis of Physiological Connection
Between the
Urinary and Genital Spheres. Urinary Fetichism Sometimes
Normal in

Animals. The Urolagnia of Masochists. The Scatology of Saints. Urolagnia
More Often a Symbolism of Act Than a Symbolism of Object. Only
Occasionally an Olfactory Fetichism. Comparative Rarity of Coprolagnia.
Influence of Nates Fetichism as a Transition to Coprolagnia, Ideal
Coprolagnia. Olfactory Coprolagnia. Urolagnia and Coprolagnia as Symbols
of Coitus.

IV.

Animals as Sources of Erotic Symbolism. Mixoscopic Zoophilia. The
Stuff-fetichisms. Hair-fetichism. The Stuff-fetichisms Mainly on a Tactile
Base. Erotic Zoophilia. Zooerastia. Bestiality. The Conditions that Favor
Bestiality. Its Wide Prevalence Among Primitive Peoples and Among
Peasants. The Primitive Conception of Animals. The Goat. The Influence of
Familiarity With Animals. Congress Between Women and Animals. The Social
Reaction Against Bestiality.

V.

Exhibitionism. Illustrative Cases. A Symbolic Perversion of Courtship. The
Impulse to Defile. The Exhibitionist's Psychic Attitude. The Sexual Organs
as Fetiches. Phallus Worship. Adolescent Pride in Sexual Development.
Exhibitionism of the Nates. The Classification of the Forms of
Exhibitionism. Nature of the Relationship of Exhibitionism to Epilepsy.

VI.

The Forms of Erotic Symbolism are Simulacra of Coitus. Wide Extension of

Erotic Symbolism. Fetichism Not Covering the Whole Ground of Sexual Selection. It is Based on the Individual Factor in Selection. Crystallization. The Lover and the Artist. The Key to Erotic Symbolism is to be Found in the Emotional Sphere. The Passage to Pathological Extremes.

THE MECHANISM OF DETUMESCENCE.

I.

The Psychological Significance of Detumescence. The Testis and the Ovary. Sperm Cell and Germ Cell. Development of the Embryo. The External Sexual Organs. Their Wide Range of Variation. Their Nervous Supply. The Penis. Its Racial Variations. The Influence of Exercise. The Scrotum and Testicles. The Mons Veneris. The Vulva. The Labia Majora and their Varieties. The Public Hair and Its Characters. The Clitoris and Its Functions. The Anus as an Erogenous Zone. The Nymphæ and their Function. The Vagina. The Hymen. Virginitv. The Biological Significance of the Hymen.

II.

The Object of Detumescence. Erogenous Zones. The Lips. The Vascular Characters of Detumescence. Erectile Tissue. Erection in Woman. Mucous Emission in Women. Sexual Connection. The Human Mode of Intercourse. Normal Variations. The Motor Characters of Detumescence. Ejaculation. The Virile Reflex. The General Phenomena of Detumescence. The Circulatory and

Respiratory Phenomena. Blood Pressure. Cardiac Disturbance. Glandular Activity. Distillatio. The Essentially Motor Character of Detumescence. Involuntary Muscular Irradiation to Bladder, etc. Erotic Intoxication. Analogy of Sexual Detumescence and Vesical Tension. The Specifically Sexual Movements of Detumescence in Man. In Woman. The Spontaneous Movements of the Genital Canal in Woman. Their Function in Conception. Part Played by Active Movement of the Spermatozoa. The Artificial Injection of Semen. The Facial Expression During Detumescence. The Expression of Joy. The Occasional Serious Effects of Coitus.

III.

The Constituents of Semen. Function of the Prostate. The Properties of Semen. Aphrodisiacs. Alcohol, Opium, etc. Anaphrodisiacs. The Stimulant Influence of Semen in Coitus. The Internal Effects of Testicular Secretions. The Influence of Ovarian Secretion.

IV.

The Aptitude for Detumescence. Is There an Erotic Temperament? The Available Standards of Comparison. Characteristics of the Castrated. Characteristics of Puberty. Characteristics of the State of Detumescence. Shortness of Stature. Development of the Secondary Sexual Characters. Deep Voice. Bright Eyes. Glandular Activity. Everted Lips. Pigmentation. Profuse Hair. Dubious Significance of Many of These Characters.

THE PSYCHIC STATE IN PREGNANCY.

The Relationship of Maternal and Sexual Emotion.

INDEX OF SUBJECTS.

EROTIC SYMBOLISM.

I.

The Definition of Erotic Symbolism--Symbolism of Act and
Symbolism of
Object--Erotic Fetichism--Wide extension of the symbols
of Sex--The
Immense Variety of Possible Erotic Fetiches--The Normal
Foundations of
Erotic Symbolism--Classification of the Phenomena--The
Tendency to
Idealize the Defects of a Beloved Person--Stendhal's
"Crystallization."

By "erotic symbolism" I mean that tendency whereby the lover's attention is diverted from the central focus of sexual attraction to some object or process which is on the periphery of that focus, or is even outside of it altogether, though recalling it by association of contiguity or of similarity. It thus happens that tumescence, or even in extreme cases detumescence, may be provoked by the contemplation of acts or objects which are away from the end of sexual conjugation.[1]

In considering the phenomena of sexual selection in a previous volume,[2] it was found that there are four or five main factors in the constitution of beauty in so far as beauty determines sexual selection. Erotic symbolism is founded on the factor of individual taste in beauty; it arises as a specialized development of that factor, but it is, nevertheless, incorrect to merge it in sexual selection. The attractive characteristics of a beloved woman or man, from the point of view of sexual selection, are a complex but harmonious whole leading up to a desire for the complete possession of the person who displays them. There is no tendency to isolate and dissociate any single character from the individual and to concentrate attention upon that character at the expense of the attention bestowed upon the individual generally. As soon as such a tendency begins to show itself, even though only in a slight or temporary form, we may say that there is erotic symbolism.

Erotic symbolism is, however, by no means confined to the individualizing

tendency to concentrate amorous attention upon some single characteristic of the adult woman or man who is normally the object of sexual love. The adult human being may not be concerned at all, the attractive object or act may not even be human, not even animal, and we may still be concerned with a symbol which has parasitically rooted itself on the fruitful site of sexual emotion and absorbed to itself the energy which normally goes into the channels of healthy human love having for its final end the procreation of the species. Thus understood in its widest sense, it may be said that every sexual perversion, even homosexuality, is a form of erotic symbolism, for we shall find that in every case some object or act that for the normal human being has little or no erotic value, has assumed such value in a supreme degree; that is to say, it has become a symbol of the normal object of love. Certain perversions are, however, of such great importance on account of their wide relationships, that they cannot be adequately discussed merely as forms of erotic symbolism. This is notably the case as regards homosexuality, auto-erotism, and algolagnia, all of which phenomena have therefore been separately discussed in previous studies. We are now mainly concerned with manifestations which are more narrowly and exclusively symbolical.

A portion of the field of erotic symbolism is covered by what Binet (followed by Lombroso, Krafft-Ebing, and others) has termed "erotic fetichism," or the tendency whereby sexual attraction is unduly exerted by some special part or peculiarity of the body, or by some

inanimate object
which has become associated with it. Such erotic
symbolism of object
cannot, however, be dissociated from the even more
important erotic
symbolism of process, and the two are so closely bound
together that we
cannot attain a truly scientific view of them until we
regard them broadly
as related parts of a common psychic tendency. If, as
Groos asserts,[3] a
symbol has two chief meanings, one in which it indicates
a physical
process which stands for a psychic process, and another
in which it
indicates a part which represents the whole, erotic
symbolism of act
corresponds to the first of these chief meanings, and
erotic symbolism of
object to the other.

Although it is not impossible to find some germs of
erotic symbolism in
animals, in its more pronounced manifestations it is
only found in the
human species. It could not be otherwise, for such
symbolism involves not
only the play of fancy and imagination, the idealizing
aptitude, but also
a certain amount of power of concentrating the attention
on a point
outside the natural path of instinct and the ability to
form new mental
constructions around that point. There are, indeed, as
we shall see,
elementary forms of erotic symbolism which are not
uncommonly associated
with feeble-mindedness, but even these are still
peculiarly human, and in
its less crude manifestations erotic symbolism easily
lends itself to
every degree of human refinement and intelligence.

"It depends primarily upon an increase of the
psychological

process of representation," Colin Scott remarks of sexual symbolism generally, "involving greater powers of comparison and analysis as compared with the lower animals. The outer impressions come to be clearly distinguished as such, but at the same time are often treated as symbols of inner experiences, and a meaning read into them which they would not otherwise possess.

Symbolism or fetichism is, indeed, just the capacity to see meaning, to emphasize something for the sake of other things which do not appear. In brain terms it indicates an activity of the higher centers, a sort of side-tracking or long-circuiting of the primitive energy; ... Rosetti's poem, 'The Woodspurge,' gives a concrete example of the formation of such a symbol. Here the otherwise insignificant presentation of the three-cupped woodspurge, representing originally a mere side-current of the stream of consciousness, becomes the intellectual symbol or fetich of the whole psychosis forever after. It seems, indeed, as if the stronger the emotion the more likely will become the formation of an overlying symbolism, which serves to focus and stand in the place of something greater than itself; nowhere at least is symbolism a more characteristic feature than as an expression of the sexual instinct. The passion of sex, with its immense hereditary background, in early man became centered often upon the most trivial and unimportant features....

This

symbolism, now become fetichistic, or symbolic in a bad sense, is

at least an exercise of the increasing representative power of

man, upon which so much of his advancement has depended, while it

also served to express and help to purify his most perennial

emotion." (Colin Scott, "Sex and Art," American Journal of

Psychology, vol. vii, No. 2, p. 189.)

In the study of "Love and Pain" in a previous volume, the analysis of the

large and complex mass of sexual phenomena which are associated with pain,

gradually resolved them to a considerable extent into a special case of

erotic symbolism; pain or restraint, whether inflicted on or by the loved

person, becomes, by a psychic process that is usually unconscious, the

symbol of the sexual mechanism, and hence arouses the same emotions as

that mechanism normally arouses. We may now attempt to deal more broadly

and comprehensively with the normal and abnormal aspects of erotic

symbolism in some of their most typical and least mixed forms.

"When our human imagination seeks to animate artificial things," Huysmans

writes in Là-bas, "it is compelled to reproduce the movements of animals

in the act of propagation. Look at machines, at the play of pistons in the

cylinders; they are Romeos of steel in Juliets of cast-iron." And not only

in the work of man's hands but throughout Nature we find sexual symbols

which are the less deniable since, for the most part, they make not the

slightest appeal to even the most morbid human

imagination. Language is full of metaphorical symbols of sex which constantly tend to lose their poetic symbolism and to become commonplace. Semen is but seed, and for the Latins especially the whole process of human sex, as well as the male and female organs, constantly presented itself in symbols derived from agricultural and horticultural life. The testicles were beans (*_fabæ_*) and fruit or apples (*_poma_* and *_mala_*); the penis was a tree (*_arbor_*), or a stalk (*_thyrsus_*), or a root (*_radix_*), or a sickle (*_falx_*), or a ploughshare (*_vomer_*). The semen, again, was dew (*_ros_*). The labia majora or minora were wings (*_alæ_*); the vulva and vagina were a field (*_ager_* and *_campus_*), or a ploughed furrow (*_sulcus_*), or a vineyard (*_vinea_*), or a fountain (*_fons_*), while the pudendal hair was herbage (*_plantaria_*).[4] In other languages it is not difficult to trace similar and even identical imagery applied to sexual organs and sexual acts. Thus it is noteworthy that Shakespeare more than once applies the term "ploughed" to a woman who has had sexual intercourse. The Talmud calls the labia minora the doors, the labia majora hinges, and the clitoris the key. The Greeks appear not only to have found in the myrtle-berry, the fruit of a plant sacred to Venus, the image of the clitoris, but also in the rose an image of the feminine labia; in the poetic literature of many countries, indeed, this imagery of the rose may be traced in a more or less veiled manner.[5]

The widespread symbolism of sex arose in the theories and conceptions of

primitive peoples concerning the function of generation and its nearest analogies in Nature; it was continued for the sake of the vigorous and expressive terminology which it furnished both for daily life and for literature; its final survivals were cultivated because they furnished a delicately æsthetic method of approaching matters which a growing refinement of sentiment made it difficult for lovers and poets to approach in a more crude and direct manner. Its existence is of interest to us now because it shows the objective validity of the basis on which erotic symbolism, as we have here to understand it, develops. But from first to last it is a distinct phenomenon, having a more or less reasoned and intellectual basis, and it scarcely serves in any degree to feed the sexual impulse. Erotic symbolism is not intellectual but emotional in its origin; it starts into being, obscurely, with but a dim consciousness or for the most part none at all, either suddenly from the shock of some usually youthful experience, or more gradually through an instinctive brooding on those things which are most intimately associated with a sexually desirable person.

The kind of soil on which the germs of erotic symbolism may develop is well seen in cases of sexual hyperæsthesia. In such cases all the emotionally sexual analogies and resemblances, which in erotic symbolism are fixed and organized, may be traced in vague and passing forms, a single hyperæsthetic individual perhaps presenting a great variety of germinal

symbolisms.

Thus it has been recorded of an Italian nun (whose sister became a prostitute) that from the age of 8 she had desire for coitus, from the age of 10 masturbated, and later had homosexual feelings, that the same feelings and practices continued after she had taken the veil, though from time to time they assumed religious equivalents. The mere contact, indeed, of a priest's hand, the news of the presentation of an ecclesiastic she had known to a bishopric, the sight of an ape, the contemplation of the crucified Christ, the figure of a toy, the picture of a demon, the act of defecation in the children entrusted to her care (whom, on this account, and against the regulations, she would accompany to the closets), especially the sight and the mere recollection of flies in sexual connection--all these things sufficed to produce in her a powerful orgasm.

(_Archivio di Psichiatria_, 1902, fasc. II-III, p. 338.)

A boy of 15 (given to masturbation), studied by Macdonald in America, was similarly hyperæsthetic to the symbols of sexual emotion. "I like amusing myself with my comrades," he told Macdonald, "rolling ourselves into a ball, which gives one a funny kind of warmth. I have a special pleasure in talking about some things. It is the same when the governess kisses me on saying good night or when I lean against her breast.

I have that
sensation, too, when I see some of the pictures in
the comic
papers, but only in those representing a woman, as
when a young
man skating trips up a girl so that her clothes are
raised a
little. When I read how a man saved a young girl
from drowning,
so that they swam together, I had the same
sensation. Looking at
the statues of women in the museum produces the same
effect, or
when I see naked babies, or when a mother suckles a
child. I
have often had that sensation when reading novels I
ought not to
read, or when looking at a new-born calf, or seeing
dogs and cows
and horses mounting on each other. When I see a girl
flirting
with a boy, or leaning on his shoulder or with his
arm round her
waist, I have an erection. It is the same when I see
women and
little girls in bathing costume, or when boys talk
of what their
fathers and mothers do together. In the Natural
History Museum I
often see things which give me that sensation. One
day when I
read how a man killed a young girl and carried her
into a wood
and undressed her I had a feeling of enjoyment. When
I read of
men who were bastards the idea of a woman having a
child in that
way gives me this sensation. Some dances, and seeing
young girls
astride a horse, excited me, too, and so in a circus
when a woman
was shot out of a cannon and her skirts flew in the
air. It has
no effect on me when I see men naked. Sometimes I
enjoy seeing

women's underclothes in a shop, or when I see a lady
or a girl
buying them, especially if they are drawers. When I
saw a lady in
a dress which buttoned from top to bottom it had
more effect on
me than seeing underclothes. Seeing dogs coupling
gives me more
pleasure than looking at pretty women, but less than
looking at
pretty little girls." In order of increasing
intensity he placed
the phenomena that affected him thus: The coupling
of flies, then
of horses, then the sight of women's undergarments,
then a boy
and a girl flirting, then cows mounting on each
other, the
statues of women with naked breasts, then contact
with the
governess's body and breasts, finally coitus.
(Arthur Macdonald,
Le Criminel-Type, pp. 126 et seq.)

It is worthy of remark that the instinct of
nutrition, when
restrained, may exhibit something of an analogous
symbolism,
though in a minor degree, to that of sex. The ways
in which a
hyperæsthetic hunger may seek its symbols are
illustrated in the
case of a young woman called Nadia, who during
several years was
carefully studied by Janet. It is a case of
obsession ("maladie
du scrupule"), simulating hysterical anorexia, in
which the
patient, for fear of getting fat, reduced her
nourishment to the
smallest possible amount. "Nadia is generally
hungry, even very
hungry. One can tell this by her actions; from time
to time she
forgets herself to such an extent as to devour

greedily anything

she can put her hands on. At other times, when she cannot resist

the desire to eat, she secretly takes a biscuit. She feels

horrible remorse for the action, but, all the same, she does it

again. Her confidences are very curious. She recognizes that a

great effort is needed to avoid eating, and considers she is a

heroine to resist so long. 'Sometimes I spent whole hours in

thinking about food, I was so hungry; I swallowed my saliva, I

bit my handkerchief, I rolled on the floor, I wanted to eat so

badly. I would look in books for descriptions of meals and

feasts, and tried to deceive my hunger by imagining that I was

sharing all these good things,' " (P. Janet, "La Maladie du

Scrupule," *_Revue Philosophique_*, May, 1901, p. 502.) The

deviations of the instinct of nutrition are, however, confined

within narrow limits, and, in the nature of things, hunger,

unlike sexual desire, cannot easily accept a fetich.

"There is almost no feature, article of dress, attitude, act," Stanley

Hall declares, "or even animal or perhaps object in nature, that may not

have to some morbid soul specialized erogenic and erethic power." [6] Even

a mere shadow may become a fetich. Goron tells of a merchant in Paris--a

man with a reputation for ability, happily married and the father of a

family, altogether irreproachable in his private life--who was returning

home one evening after a game of billiards with a friend, when, on

chancing to raise his eyes, he saw against a lighted window the shadow of a woman changing her chemise. He fell in love with that shadow and returned to the spot every evening for many months to gaze at the window. Yet--and herein lies the fetichism--he made no attempt to see the woman or to find out who she was; the shadow sufficed; he had no need of the realty.[7] It is even possible to have a negative fetich, the absence of some character being alone demanded, and the case has been recorded in Chicago of an American gentleman of average intelligence, education, and good habits who, having as a boy cherished a pure affection for a girl whose leg had been amputated, throughout life was relatively impotent with normal women, but experienced passion and affection for women who had lost a leg; he was found by his wife to be in extensive correspondence with one-legged women all over the country, expending no little money on the purchase of artificial legs for his various protegées.[8]

It is important to remember, however, that while erotic symbolism becomes fantastic and abnormal in its extreme manifestations, it is in its essence absolutely normal. It is only in the very grossest forms of sexual desire that it is altogether absent. Stendhal described the mental side of the process of tumescence as a crystallization, a process whereby certain features of the beloved person present points around which the emotions held in solution in the lover's mind may concentrate and deposit themselves in dazzling brilliance. This process inevitably tends to take

place around all those features and objects associated with the beloved person which have most deeply impressed the lover's mind, and the more sensitive and imaginative and emotional he is the more certainly will such features and objects crystallize into erotic symbols. "Devotion and love," wrote Mary Wollstonecraft, "may be allowed to hallow the garments as well as the person, for the lover must want fancy who has not a sort of sacred respect for the glove or slipper of his mistress. He would not confound them with vulgar things of the same kind." And nearly two centuries earlier Burton, who had gathered together so much of the ancient lore of love, clearly asserted the entirely normal character of erotic symbolism. "Not one of a thousand falls in love," he declares, "but there is some peculiar part or other which pleaseth most, and inflames him above the rest.... If he gets any remnant of hers, a busk-point, a feather of her fan, a shoe-tie, a lace, a ring, a bracelet of hair, he wears it for a favor on his arm, in his hat, finger, or next his heart; as Laodamia did by Protesilaus, when he went to war, sit at home with his picture before her: a garter or a bracelet of hers is more precious than any Saint's Relique, he lays it up in his casket (O blessed Relique) and every day will kiss it: if in her presence his eye is never off her, and drink he will where she drank, if it be possible, in that very place," etc.[9]

Burton's accuracy in describing the ways of lovers in his century is shown by a passage in Hamilton's *Mémoires de Gramont*. Miss

Price, one of the beauties of Charles II's court,
and Dongan were
tenderly attached to each other; when the latter
died he left
behind a casket full of all possible sorts of love-
tokens
pertaining to his mistress, including, among other
things, "all
kinds of hair." And as regards France, Burton's
contemporary,
Howell, wrote in 1627 in his Familiar Letters
concerning the
repulse of the English at Rhé: "A captain told me
that when they
were rifling the dead bodies of the French gentlemen
after the
first invasion they found that many of them had
their mistresses'
favors tied about their genitories."

Schurig (Spermatologia, p. 357) at the beginning
of the
eighteenth century knew a Belgian lady who, when her
dearly loved
husband died, secretly cut off his penis and
treasured it as a
sacred relic in a silver casket. She eventually
powdered it, he
adds, and found it an efficacious medicine for
herself and
others. An earlier example, of a lady at the French
court who
embalmed and perfumed the genital organs of her dead
husband,
always preserving them in a gold casket, is
mentioned by
Brantôme. Mantegazza knew a man who kept for many
years on his
desk the skull of his dead mistress, making it his
dearest
companion. "Some," he remarks, "have slept for
months and years
with a book, a garment, a trifle. I once had a
friend who would
spend long hours of joy and emotion kissing a thread

of silk

which she had held between her fingers, now the only relic of love." (Mantegazza, Fisiologia dell' Amore, cap. X.) In the same way I knew a lady who in old age still treasured in her desk, as the one relic of the only man she had ever been attracted to, a fragment of paper he had casually twisted up in a conversation with her half a century before.

The tendency to treasure the relics of a beloved person, more especially the garments, is the simplest and commonest foundation of erotic symbolism. It is without doubt absolutely normal. It is inevitable that those objects which have been in close contact with the beloved person's body, and are intimately associated with that person in the lover's mind, should possess a little of the same virtue, the same emotional potency. It is a phenomenon closely analogous to that by which the relics of saints are held to possess a singular virtue. But it becomes somewhat less normal when the garment is regarded as essential even in the presence of the beloved person.[10]

While an extremely large number of objects and acts may be found to possess occasionally the value of erotic symbols, such symbols most frequently fall into certain well-defined groups. A vast number of isolated objects or acts may be exceptionally the focus of erotic contemplation, but the objects and acts which frequently become thus symbolic are comparatively few.

It seems to me that the phenomena of erotic symbolism may be most conveniently grouped in three great classes, on the basis of the objects or acts which arouse them.

I. PARTS OF THE BODY.--_A. Normal:_ Hand, foot, breasts, nates, hair, secretions and excretions, etc.

B. Abnormal: Lameness, squinting, pitting of smallpox, etc. Paidophilia or the love of children, presbyophilia or the love of the aged, and necrophilia or the attraction for corpses, may be included under this head, as well as the excitement caused by various animals.

II. INANIMATE OBJECTS.[11]--_A. Garments:_ Gloves, shoes and stockings and garters, caps, aprons, handkerchiefs, underlinen.

B. Impersonal Objects: Here may be included all the various objects that may accidentally acquire the power of exciting sexual feeling in auto-erotism. Pygmalionism may also be included.

III. ACTS AND ATTITUDES.--_A. Active:_ Whipping, cruelty, exhibitionism.

B. Passive: Being whipped, experiencing cruelty. Personal odors and the sound of the voice may be included under this head. _C. Mixoscopic:_ The vision of climbing, swinging, etc. The acts of urination and defecation. The coitus of animals.

Although the three main groups into which the phenomena of erotic symbolism are here divided may seem fairly distinct, they are yet very

closely allied, and indeed overlap, so that it is possible, as we shall see, for a single complex symbol to fall into all three groups.

A very complete kind of erotic symbolism is furnished by Pygmalionism or the love of statues.[12] It is exactly analogous to the child's love of a doll, which is also a form of sexual (though not erotic) symbolism. In a somewhat less abnormal form, erotic symbolism probably shows itself in its simplest shape in the tendency to idealize unbeautiful peculiarities in a beloved person, so that such peculiarities are ever afterward almost or quite essential in order to arouse sexual attraction. In this way men have become attracted to limping women. Even the most normal man may idealize a trifling defect in a beloved woman. The attention is inevitably concentrated on any such slight deviation from regular beauty, and the natural result of such concentration is that a complexus of associated thoughts and emotions becomes attached to something that in itself is unbeautiful. A defect becomes an admired focus of attention, the embodied symbol of the lover's emotion.

Thus a mole is not in itself beautiful, but by the tendency to erotic symbolism it becomes so. Persian poets especially have lavished the richest imagery on moles (Anis El-Ochchâq in Bibliothèque des Hautes Etudes, fasc, 25, 1875); the Arabs, as Lane remarks (Arabian Society in the Middle Ages, p. 214), are equally extravagant in their admiration of a mole.

Stendhal long since well described the process by which a defect becomes a sexual symbol. "Even little defects in a woman's face," he remarked, "such as a smallpox pit, may arouse the tenderness of a man who loves her, and throw him into deep reverie when he sees them in another woman. It is because he has experienced a thousand feelings in the presence of that smallpox mark, that these feelings have been for the most part delicious, all of the highest interest, and that, whatever they may have been, they are renewed with incredible vivacity on the sight of this sign, even when perceived on the face of another woman. If in such a case we come to prefer and love ugliness, it is only because in such a case ugliness is beauty. A man loved a woman who was very thin and marked by smallpox; he lost her by death. Three years later, in Rome, he became acquainted with two women, one very beautiful, the other thin and marked by smallpox, on that account, if you will, rather ugly. I saw him in love with this plain one at the end of a week, which he had employed in effacing her plainness by his memories." (De l'Amour, Chapter XVII.)

In the tendency to idealize the unbeautiful features of a beloved person erotic symbolism shows itself in a simple and normal form. In a less simple and more morbid form it appears in persons in whom the normal paths of sexual gratification are for some reasons inhibited, and who are thus led to find the symbols of natural love in unnatural

perversions. It is for this reason that so many erotic symbolisms take root in childhood and puberty, before the sexual instincts have reached full development. It is for the same reason also, that, at the other end of life, when the sexual energies are failing, erotic symbols sometimes tend to be substituted for the normal pleasures of sex. It is for this reason, again, that both men and women whose normal energies are inhibited sometimes find the symbols of sexual gratification in the caresses of children.

The case of a schoolmistress recorded by Penta instructively shows how an erotic symbolism of this last kind may develop by no means as a refinement of vice, but as the one form in which sexual gratification becomes possible when normal gratification has been pathologically inhibited. F.R., aged 48, schoolmistress; she was some years ago in an asylum with religious mania, but came out well in a few months. At the age of 12 she had first experienced sexual excitement in a railway train from the jolting of the carriage. Soon after she fell in love with a youth who represented her ideal and who returned her affection. When, however, she gave herself to him, great was her disillusion and surprise to find that the sexual act which she had looked forward to could not be accomplished, for at the first contact there was great pain and spasmodic resistance of the vagina. There was a condition of vaginismus. After repeated attempts on subsequent

occasions her lover desisted. Her desire for intercourse increased, however, rather than diminished, and at last she was able to tolerate coitus, but the pain was so great that she acquired a horror of the sexual embrace and no longer sought it. Having much will power, she restrained all erotic impulses during many years. It was not until the period of the menopause that the long repressed desires broke out, and at last found a symbolical outlet that was no longer normal, but was felt to supply a complete gratification. She sought the close physical contact of the young children in her care. She would lie on her bed naked, with two or three naked children, make them suck her breasts and press them to every part of her body. Her conduct was discovered by means of other children who peeped through the keyhole, and she was placed under Penta for treatment. In this case the loss of moral and mental inhibition, due probably to troubles of the climacteric, led to indulgence, under abnormal conditions, in those primitive contacts which are normally the beginning of love, and these, supported by the ideal image of the early lover, constituted a complete and adequate symbol of natural love in a morbidly perverted individual. (P. Penta, Archivio delle Psicopatie Sessuali, January, 1896.)

FOOTNOTES:

[1] The term "erotic symbolism" has already been employed by Eulenburg (*_Sexuale Neuropathie_*, 1895, p. 101). It must be borne in mind that this term, implying the specific emotion, is much narrower than the term "sexual symbolism," which may be used to designate a great variety of ritual and social practices which have played a part in the evolution of civilization.

[11] Chevalier (De l'Inversion, 1885; id., L'Inversion Sexuelle, 1892, p. 52), followed by E. Laurent (L'Amour Morbide, 1891, Chapter X), separates this group from other fetichistic perversions, under the head of "azoöphilie." I see no adequate ground for this step. The various forms of fetichism are too intimately associated to permit of any group of them being violently separated from the others.

[12] This has already been considered as a perversion founded on vision, in discussing Sexual Selection in Man. IV.

II.

Foot-fetichism and Shoe-fetichism--Wide Prevalence and Normal Basis--Restif de la Bretonne--The Foot a Normal Focus of Sexual Attraction Among Some Peoples--The Chinese, Greeks, Romans, Spaniards, etc.--The Congenital Predisposition in Erotic Symbolism--The Influence of Early Association and Emotional Shock--Shoe-fetichism in

Relation to
Masochism--The Two Phenomena Independent Though Allied--
The Desire to be
Trodden On--The Fascination of Physical Constraint--The
Symbolism of
Self-inflicted Pain--The Dynamic Element in Erotic
Symbolism--The
Symbolism of Garments.

Of all forms of erotic symbolism the most frequent is
that which idealizes
the foot and the shoe. The phenomena we here encounter
are sometimes so
complex and raise so many interesting questions that it
is necessary to
discuss them somewhat fully.

It would seem that even for the normal lover the foot is
one of the most
attractive parts of the body. Stanley Hall found that
among the parts
specified as most admired in the other sex by young men
and women who
answered a questionnaire the feet came fourth (after
the eyes, hair,
stature and size).[13] Casanova, an acute student and
lover of women who
was in no degree a foot fetichist, remarks that all men
who share his
interest in women are attracted by their feet; they
offer the same
interest, he considers, as the question of the
particular edition offers
to the book-lover.[14]

In a report of the results of a questionnaire
concerning
children's sense of self, to which over 500 replies
were
received, Stanley Hall thus summarizes the main
facts ascertained
with reference to the feet: "A special period of
noticing the
feet comes somewhat later than that in which the

hands are
discovered to consciousness. Our records afford
nearly twice as
many cases for feet as for hands. The former are
more remote from
the primary psychic focus or position, and are also
more often
covered, so that the sight of them is a more marked
and
exceptional event. Some children become greatly
excited whenever
their feet are exposed. Some infants show signs of
fear at the
movement of their own knees and feet covered, and
still more
often fright is the first sensation which signalizes
the child's
discovery of its feet.... Many are described as
playing with them
as if fascinated by strange, newly-discovered toys.
They pick
them up and try to throw them away, or out of the
cradle, or
bring them to the mouth, where all things tend to
go.... Children
often handle their feet, pat and stroke them, offer
them toys and
the bottle, as if they, too, had an independent
hunger to
gratify, an ego of their own.... Children often
develop [later]
a special interest in the feet of others, and
examine, feel them,
etc., sometimes expressing surprise that the pinch
of the
mother's toe hurts her and not the child, or
comparing their own
and the feet of others point by point. Curious, too,
are the
intensifications of foot-consciousness throughout
the early years
of childhood, whenever children have the exceptional
privilege of
going barefoot, or have new shoes. The feet are
often

apostrophized, punished, beaten sometimes to the point of pain
for breaking things, throwing the child down, etc. Several children have habits, which reach great intensity, and then vanish, of touching or tickling the feet, with gales of laughter, and a few are described as showing an almost morbid reluctance to wear anything upon the feet, or even to having them touched by others.... Several almost fall in love with the great toe or the little one, especially admiring some crease or dimple in it, dressing it in some rag of silk or bit of ribbon, or cut-off glove fingers, winding it with string, prolonging it by tying on bits of wood. Stroking the feet of others, especially if they are shapely, often becomes almost a passion with young children, and several adults confess a survival of the same impulse which it is an exquisite pleasure to gratify. The interest of some mothers in babies' toes, the expressions of which are ecstatic and almost incredible, is a factor of great importance." (G. Stanley Hall, "Some Aspects of the Early Sense of Self," *American Journal of Psychology*, April, 1898.) In childhood, Stanley Hall remarks elsewhere (*Adolescence*, vol. ii, p. 104), "a form of courtship may consist solely in touching feet under the desk." It would seem that even animals have a certain amount of sexual consciousness in the feet; I have noticed a male donkey, just before coitus, bite the feet of his partner.

At the same time it is scarcely usual for the normal lover, in most civilized countries to-day, to attach primary importance to the foot, such as he very frequently attaches to the eyes, though the feet play a very conspicuous part in the work of certain novelists.[15]

In a small but not inconsiderable minority of persons, however, the foot or the boot becomes the most attractive part of a woman, and in some morbid cases the woman herself is regarded as a comparatively unimportant appendage to her feet or her boots. The boots under civilized conditions much more frequently constitute the sexual symbol than do the feet themselves; this is not surprising since in ordinary life the feet are not often seen.

It is usually only under exceptionally favoring conditions that foot-fetichism occurs, as in the case recorded by Marandon de Montyel of a doctor who had been brought up in the West Indies. His mother had been insane and he himself was subject to obsessions, especially of being incapable of urinating; he had had nocturnal incontinence of urine in childhood. All the women of the people in the West Indies go about with naked feet, which are often beautiful. His puberty evolved under this influence, and foot-fetichism developed. He especially admired large, fat, arched feet, with delicate skin and large, regular toes. He masturbated with images of feet. At 15 he had relations with a

colored chambermaid, but feared to mention his fetichism, though it was the touch of her feet that chiefly excited him. He now gave up masturbation, and had a succession of mistresses, but was always ashamed to confess his fancies until, at the age of 33, in Paris, a very intelligent woman who had become his mistress discovered his mania and skillfully enabled him to yield to it without shock to his modesty. He was devoted to this mistress, who had very beautiful feet (he had been horrified by the feet of Europeans generally), until she finally left him. (_Archives de Neurologie_, October, 1904.)

Probably the first case of shoe-fetichism ever recorded in any detail is that of Restif de la Bretonne (1734-1806), publicist and novelist, one of the most remarkable literary figures of the later eighteenth century in France. Restif was a neurotic subject, though not to an extreme degree, and his shoe-fetichism, though distinctly pronounced, was not pathological; that is to say, that the shoe was not itself an adequate gratification of the sexual impulse, but simply a highly important aid to tumescence, a prelude to the natural climax of detumescence; only occasionally, and *_faute de mieux_*, in the absence of the beloved person, was the shoe used as an adjunct to masturbation. In Restif's stories and elsewhere the attraction of the shoe is frequently discussed or used as a motive. His first

decided

literary success, *Le Pied de Fanchette*, was suggested by a vision of a girl with a charming foot, casually seen in the

street. While all such passages in his books are really founded

on his own personal feelings and experiences, in his elaborate

autobiography, *Monsieur Nicolas*, he has frankly set forth the

gradual evolution and cause of his idiosyncrasy. The first

remembered trace dated from the age of 4, when he was able to

recall having remarked the feet of a young girl in his native

place. Restif was a sexually precocious youth, and at the age of

9, though both delicate in health and shy in manners, his

thoughts were already absorbed in the girls around him. "While

little Monsieur Nicolas," he tells us, "passed for a Narcissus,

his thoughts, as soon as he was alone, by night or by day, had no

other object than that sex he seemed to flee from. The girls most

careful of their persons were naturally those who pleased him

most, and as the part least easy to keep clean is that which

touches the earth it was to the foot-gear that he mechanically

gave his chief attention. Agathe, Reine, and especially

Madeleine, were the most elegant of the girls at that time; their

carefully selected and kept shoes, instead of laces or buckles,

which were not yet worn at Sacy, had blue or rose ribbon,

according to the color of the skirt. I thought of these girls

with emotion; I desired--I knew not what; but I desired something, if it were only to subdue them." The origin Restif here assigns to his shoe-fetichism may seem paradoxical; he admired the girls who were most clean and neat in their dress, he tells us, and, therefore, paid most attention to that part of their clothing which was least clean and neat. But, however paradoxical the remark may seem, it is psychologically sound. All fetichism is a kind of not necessarily morbid obsession, and as the careful work of Janet and others in that field has shown, an obsession is a fascinated attraction to some object or idea which gives the subject a kind of emotional shock by its contrast to his habitual moods or ideas. The ordinary morbid obsession cannot usually be harmoniously coordinated with the other experiences of the subject's daily life, and shows, therefore, no tendency to become pleasurable. Sexual fetichisms, on the other hand, have a reservoir of agreeable emotion to draw on, and are thus able to acquire both stability and harmony. It will also be seen that no element of masochism is involved in Restif's fetichism, though the mistake has been frequently made of supposing that these two manifestations are usually or even necessarily allied. Restif wishes to subject the girl who attracts him, he has no wish to be subjected by her. He was especially dazzled by a young girl from another

town, whose shoes
were of a fashionable cut, with buckles, "and who
was a charming
person besides." She was delicate as a fairy, and
rendered his
thoughts unfaithful to the robust beauties of his
native Sacy.
"No doubt," he remarks, "because, being frail and
weak myself, it
seemed to me that it would be easier to subdue her."
"This taste
for the beauty of the feet," he continues, "was so
powerful in me
that it unfailingly aroused desire and would have
made me
overlook ugliness. It is excessive in all those who
have it." He
admired the foot as well as the shoe: "The
factitious taste for
the shoe is only a reflection of that for pretty
feet. When I
entered a house and saw the boots arranged in a row,
as is the
custom, I would tremble with pleasure; I blushed and
lowered my
eyes as if in the presence of the girls themselves.
With this
vivacity of feeling and a voluptuousness of ideas
inconceivable
at the age of 10 I still fled, with an involuntary
impulse of
modesty, from the girls I adored."

We may clearly see how this combination of sensitive
and
precocious sexual ardor with extreme shyness,
furnished the soil
on which the germ of shoe-fetichism was able to gain
a firm root
and persist in some degree throughout a long life
very largely
given up to a pursuit of women, abnormal rather by
its
excessiveness than its perversity. A few years
later, he tells

us, he happened to see a pretty pair of shoes in a bootmaker's shop, and on hearing that they belonged to a girl whom at that time he reverently adored at a distance he blushed and nearly fainted.

In 1749 he was for a time attracted to a young woman very much older than himself; he secretly carried away one of her slippers and kept it for a day; a little later he again took away a shoe of the same woman which had fascinated him when on her foot, and, he seems to imply, he used it to masturbate with.

Perhaps the chief passion of Restif's life was his love for Colette Parangon. He was still a boy (1752), she was the young and virtuous wife of the printer whose apprentice Restif was and in whose house he lived. Madame Parangon, a charming woman, as she is described, was not happily married, and she evidently felt a tender affection for the boy whose excessive love and reverence for her were not always successfully concealed.

"Madonna Parangon," he tells us, "possessed a charm which I could never resist, a pretty little foot; it is a charm which arouses more than tenderness. Her shoes, made in Paris, had that voluptuous elegance which seems to communicate soul and life. Sometimes Colette wore shoes of simple white druggot or with silver flowers; sometimes rose-colored slippers with green heels, or green with rose heels; her supple feet, far from

deforming her
shoes, increased their grace and rendered the form
more
exciting." One day, on entering the house, he saw
Madame Parangon
elegantly dressed and wearing rose-colored shoes
with tongues,
and with green heels and a pretty rosette. They were
new and she
took them off to put on green slippers with rose
heels and
borders which he thought equally exciting. As soon
as she had
left the room, he continues, "carried away by the
most impetuous
passion and idolizing Colette, I seemed to see her
and touch her
in handling what she had just worn; my lips pressed
one of these
jewels, while the other, deceiving the sacred end of
nature, from
excess of exaltation replaced the object of sex (I
cannot express
myself more clearly). The warmth which she had
communicated to
the insensible object which had touched her still
remained and
gave a soul to it; a voluptuous cloud covered my
eyes." He adds
that he would kiss with rage and transport whatever
had come in
close contact with the woman he adored, and on one
occasion
eagerly pressed his lips to her cast-off underlinen,
_vela
secretiora penetralium_.

At this period Restif's foot-fetichism reached its
highest point
of development. It was the aberration of a highly
sensitive and
very precocious boy. While the preoccupation with
feet and shoes
persisted throughout life, it never became a
complete perversion

and never replaced the normal end of sexual desire.
His love for
Madam Parangon, one of the deepest emotions in his
whole life,
was also the climax of his shoe-fetichism. She
represented his
ideal woman, an ethereal sylph with wasp-waist and a
child's
feet; it was always his highest praise for a woman
that she
resembled Madame Parangon, and he desired that her
slipper should
be buried with him. (Restif de la Bretonne,
Monsieur Nicolas,
vols. i-iv, vol. xiii, p. 5; id., _Mes
Inscriptions_, pp. ci-cv.)

Shoe-fetichism, more especially if we include under
this term all
the cases of real or pseudo-masochism in which an
attraction to
the boots or slippers is the chief feature, is a not
infrequent
phenomenon, and is certainly the most frequently
occurring form
of fetichism. Many cases are brought together by
Krafft-Ebing in
his _Psychopathia Sexualis_. Every prostitute of any
experience
has known men who merely desire to gaze at her
shoes, or possibly
to lick them, and who are quite willing to pay for
this
privilege. In London such a person is known as a
"bootman," in
Germany as a "Stiefelfrier."

The predominance of the foot as a focus of sexual
attraction, while among
us to-day it is a not uncommon phenomenon, is still not
sufficiently
common to be called normal; the majority of even ardent
lovers do not
experience this attraction in any marked degree. But
these manifestations

of foot-fetichism which with us to-day are abnormal, even when they are not so extreme as to be morbid, may perhaps become more intelligible to us when we realize that in earlier periods of civilization, and even to-day in some parts of the world, the foot is generally recognized as a focus of sexual attraction, so that some degree of foot-fetichism becomes a normal phenomenon.

The most pronounced and the best known example of such normal foot-fetichism at the present day is certainly to be found among the Southern Chinese. For a Chinese husband his wife's foot is more interesting than her face. A Chinese woman is as shy of showing her feet to a man as a European woman her breasts; they are reserved for her husband's eyes alone, and to look at a woman's feet in the street is highly improper and indelicate. Chinese foot-fetichism is connected with the custom of compressing the feet. This custom appears to rest on the fact that Chinese women naturally possess a very small foot and is thus an example of the universal tendency in the search for beauty to accentuate, even by deformation, the racial characteristics. But there is more than this. Beauty is largely a name for sexual attractiveness, and the energy expended in the effort to make the Chinese woman's small foot still smaller is a measure of the sexual fascination which it exerts. The practice arose on the basis of the sexual attractiveness of the foot, though it has doubtless served to heighten that attractiveness, just as the small waist, which (if we may follow Stratz) is a

characteristic
beauty of the European woman, becomes to the average
European man still
more attractive when accentuated, even to the extent of
deformity, by the
compression of the corset.

Referring to the sexual fascination exerted by the
foot in China,
Matignon writes: "My attention has been drawn to
this point by a
large number of pornographic engravings, of which
the Chinese are
very fond. In all these lascivious scenes we see the
male
voluptuously fondling the woman's foot. When a
Celestial takes
into his hand a woman's foot, especially if it is
very small, the
effect upon him is precisely the same as is provoked
in a
European by the palpation of a young and firm bosom.
All the
Celestials whom I have interrogated on this point
have replied
unanimously: 'Oh, a little foot! You Europeans
cannot understand
how exquisite, how sweet, how exciting it is!' The
contact of the
genital organ with the little foot produces in the
male an
indescribable degree of voluptuous feeling, and
women skilled in
love know that to arouse the ardor of their lovers a
better
method than all Chinese aphrodisiacs--including
'giusen' and
swallows' nests--is to take the penis between their
feet. It is
not rare to find Chinese Christians accusing
themselves at
confession of having had 'evil thoughts on looking
at a woman's
foot.'" (Dr. J. Matignon, "A propos d'un Pied de
Chinoise,")

Archives d'Anthropologie Criminelle, 1898.)

It is said that a Chinese Empress, noted for her vice and having a congenital club foot, about the year 1100 B.C., desired all women to resemble her, and that the practice of compressing the foot thus arose. But this is only tradition, since, in 300 B.C., Chinese books were destroyed (Morache, Art. "Chine," _Dictionnaire Encyclopédique des Sciences Médicales_, p. 191). It is also said that the practice owes its origin to the wish to keep women indoors. But women are not secluded in China, nor does foot compression usually render a woman unable to walk. Many intelligent Chinese are of opinion that its object is to promote the development of the sexual parts and of the thighs, and so to aid both intercourse and parturition. There is no ground for believing that it has any such influence, though Morache found that the mons veneris and labia are largely developed in Chinese women, and not in Tartar women living in Pekin (who do not compress the foot). If there is any correlation between the feet and the pelvic regions, it is more probably congenital than due to the artificial compression of the feet. The ancients seem to have believed that a small foot indicated a small vagina. Restif de la Bretonne, who had ample opportunities for forming an opinion on a matter in which he took so great an interest, believed that a small foot, round and short, indicated a large

vagina (*Monsieur Nicolas*, vol. i, reprint of 1883, p. 92).

Even, however, if we admit that there is a real correlation between the foot and the vagina, that would by no means suffice to render the foot a focus of sexual attraction.

It remains the most reasonable view that the foot bandage must be regarded as strictly analogous to the waist bandage or corset which also tends to produce deformity of the constricted region.

Stratz has ingeniously remarked (*Frauenkleidung*, third edition, p. 101) that the success of the Chinese in dwarfing trees may have suggested a similar attempt in regard to women's feet, and adds that in any case both dwarfed trees and bound feet bear witness in the Mongolian to the same love for small and elegant, not to say deformed, things. For a Chinaman the deformed foot is a "golden water-lily."

Many facts (together with illustrations) bearing on Chinese deformation of the foot will be found in Ploss, *Das Weib*, vol. i, Section IV.

The significance of the sexual emotion aroused by the female foot in China and the origin of its compression begin to become clear when we realize that this foot-fetichism is merely an extreme development of a tendency which is fairly well marked among nearly all the peoples of yellow race. Jacoby, who has brought together a number of interesting facts bearing on the sexual significance of the foot, states that a

similar tendency is to be found among the Mongol and Turk peoples of Siberia, and in the east and central parts of European Russia, among the Permiaks, the Wotiaks, etc. Here the woman, at all events when young, has always her feet, as well as head, covered, however little clothing she may otherwise wear.

"On hot nights or on baking days," Jacoby states, "you may see these women with uncovered breasts, or even entirely naked without embarrassment, but you will never see them with bare feet, and no male relations, except the husband, will ever see the feet and lower part of the legs of the women in the house. These women have their modesty in their feet, and also their coquetry; to unbind the feet of a woman is for a man a voluptuous act, and the touch of the bands produces the same effect as a corset still warm from a woman's body on a European man. A woman's beauty, that which attracts and excites a man, lies in her foot; in Mordvin love poems celebrating the beauty of women there is much about her attire, especially her embroidered chemise, but as regards the charms of her person the poet is content to state that 'her feet are beautiful;' with that everything is said. The young peasant woman of the central provinces as part of her holiday raiment puts on great woollen stockings which come up to the groin and are then folded over to below the knee. To uncover the feet of a person of

the opposite
sex is a sexual act, and has thus become the symbol
of sexual
possession, so that the stocking or foot-gear became
the emblem
of marriage, as later the ring. (It was so among the
Jews, as we
see in the book of Ruth, Chapter III, v. 4, and
Chapter IV, vv.
7 and 8). St. Vladimir the Great asked in marriage
the daughter
of Prince Rogvold; as Vladimir's mother had been a
serf, the
princess proudly replied that she 'would not uncover
the feet of
a slave.' At the present time in the east of Russia
when a young
girl tries to find out by divination whom she will
have as a
husband the traditional formula is 'Come and take my
stockings
off.' Among the populations of the north and east,
it is
sometimes the bride who must do this for her husband
on the
wedding night, and sometimes the bridegroom for his
wife, not as
a token of love, but as a nuptial ceremony. Among
the
professional classes and small nobility in Russia
parents place
money in the stocking of their child at marriage as
a present for
the other partner, it being supposed that the couple
mutually
remove each other's foot raiment, as an act of
sexual possession,
the emblem of coitus." (Paul Jacoby, Archives
d'Anthropologie
Criminelle, December, 1903, p. 793.) The practice
among
ourselves of children hanging up their stockings at
night for
presents would seem to be a relic of the last-
mentioned custom.

While we may witness the sexual symbolism of the foot, with or without an associated foot-fetichism, most highly developed in Asia and Eastern Europe, it has by no means been altogether unknown in some stages of western civilization, and traces of it may be found here and there even yet. Schinz refers to the connection between the feet and sexual pleasure as existing not only among the Egyptians and the Arabs, but among the ancient Germans and the modern Spaniards,[16] while Jacoby points out that among the Greeks, the Romans, and especially the Etruscans, it was usual to represent chaste and virgin goddesses with their feet covered, even though they might be otherwise nude. Ovid, again, is never weary of dwelling on the sexual charm of the feminine foot. He represents the chaste matron as wearing a weighted *_stola_* which always fell so as to cover her feet; it was only the courtesan, or the nymph who is taking part in an erotic festival, who appears with raised robes, revealing her feet.[17] So grave a historian as Strabo, as well as Ælian, refers to the story of the courtesan Rhodope whose sandal was carried off by an eagle and dropped in the King of Egypt's lap as he was administering justice, so that he could not rest until he had discovered to whom this delicately small sandal belonged, and finally made her his queen. Kleinpaul, who repeats this story, has collected many European sayings and customs (including Turkish), indicating that the slipper is a very ancient symbol of a woman's sexual parts.[18]

In Rome, Dufour remarks, "Matrons having appropriated the use of the shoe (*_soccus_*) prostitutes were not allowed to use it, and were obliged to have their feet always naked in sandals or slippers (*_crepida_* and *_solea_*), which they fastened over the instep with gilt bands. Tibullus delights to describe his mistress's little foot, compressed by the band that imprisoned it: *_Ansaque compressos colligat arcta pedes_*. Nudity of the foot in woman was a sign of prostitution, and their brilliant whiteness acted afar as a pimp to attract looks and desires."
(Dufour, *_Histoire de la Prostitution_*, vol. II., ch. xviii.)

This feeling seems to have survived in a more or less vague and unconscious form in mediæval Europe. "In the tenth century," according to Dufour (*_Histoire de la Prostitution_*, vol. VI., p. 11), "shoes *_a la poulaine_*, with a claw or beak, pursued for more than four centuries by the anathemas of popes and the invectives of preachers, were always regarded by mediæval casuists as the most abominable emblems of immodesty. At a first glance it is not easy to see why these shoes--terminating in a lion's claw, an eagle's beak, the prow of a ship, or other metal appendage--should be so scandalous. The excommunication inflicted on this kind of foot-gear preceded the impudent invention of some libertine, who wore *_poulaines_* in the shape of the phallus, a

custom adopted also by women. This kind of
poulaine was
denounced as _mandite de Dicu_ (Ducange's Glossary,
at the word
Poulainia) and prohibited by royal ordinances (see
letter of
Charles V., 17 October, 1367, regarding the garments
of the women
of Montpellier). Great lords and ladies continued,
however, to
wear _poulaines_." In Louis XL's court they were
still worn of a
quarter of an ell in length.

Spain, ever tenacious of ancient ideas, appears to
have preserved
longer than other countries the ancient classic
traditions in
regard to the foot as a focus of modesty and an
object of sexual
attraction. In Spanish religious pictures it was
always necessary
that the Virgin's feet should be concealed, the
clergy ordaining
that her robe should be long and flowing, so that
the feet might
be covered with decent folds. Pacheco, the master
and
father-in-law of Velasquez, writes in 1649 in his
_Arte de la
Pintura_: "What can be more foreign from the respect
which we owe
to the purity of Our Lady the Virgin than to paint
her sitting
down with one of her knees placed over the other,
and often with
her sacred feet uncovered and naked. Let thanks be
given to the
Holy Inquisition which commands that this liberty
should be
corrected!" It was Pacheco's duty in Seville to see
that these
commands were obeyed. At the court of Philip IV. at
this time the
princesses never showed their feet, as we may see in

the pictures
of Velasquez. When a local manufacturer desired to
present that
monarch's second bride, Mariana of Austria, with
some silk
stockings the offer was indignantly rejected by the
Court
Chamberlain: "The Queen of Spain has no legs!"
Philip V.'s, queen
was thrown from her horse and dragged by the feet;
no one
ventured to interfere until two gentlemen bravely
rescued her and
then fled, dreading punishment by the king: they
were, however,
graciously pardoned. Reinach ("Pieds Pudiques,"
_Cultes, Mythes
et Religions_, pp. 105-110) brings together several
passages from
the Countess D'Aulnoy's account of the Madrid Court
in the
seventeenth century and from other sources, showing
how careful
Spanish ladies were as regards their feet, and how
jealous
Spanish husbands were in this matter. At this time,
when Spanish
influence was considerable, the fashion of Spain
seems to have
spread to other countries. One may note that in
Vandyck's
pictures of English beauties the feet are not
visible, though in
the more characteristically English painters of a
somewhat later
age it became usual to display them conspicuously,
while the
French custom in this matter is the farthest removed
from the
Spanish. At the present day a well-bred Spanish
woman shows as
little as possible of her feet in walking, and even
in some of
the most characteristic Spanish dances there is
little or no

kicking, and the feet may even be invisible throughout. It is noteworthy that in numerous figures of Spanish women (probably artists' models) reproduced in Ploss's *Das Weib* the stockings are worn, although the women are otherwise, in most cases, quite naked. Max Dessoir mentions ("Psychologie der Vita Sexualis," *Zeitschrift für Psychiatrie*, 1894, p. 954) that in Spanish pornographic photographs women always have their shoes on, and he considers this an indication of perversity. I have seen the statement (attributed to Gautier's *Voyage en Espagne*, where, however, it does not occur) that Spanish prostitutes uncover their feet in sign of assent, and Madame d'Aulnoy stated that in her time to show her lover her feet was a Spanish woman's final favor.

The tendency, which we thus find to be normal at some earlier periods of civilization, to insist on the sexual symbolism of the feminine foot or its coverings, and to regard them as a special sexual fascination, is not without significance for the interpretation of the sporadic manifestations of foot-fetichism among ourselves. Eccentric as foot-fetichism may appear to us, it is simply the re-emergence, by a pseudo-atavism or arrest of development, of a mental or emotional impulse which was probably experienced by our forefathers, and is often traceable among young children to-day.[19] The occasional reappearance of this bygone impulse and the stability which it may acquire are thus

conditioned by the sensitive reaction of an abnormally nervous and usually precocious organism to influences which, among the average and ordinary population of Europe to-day, are either never felt, or quickly outgrown, or very strictly subordinated in the highly complex crystallizations which the course of love and the process of tumescence create within us.

It may be added that this is by no means true of foot-fetichism only. In some other fetichisms a seemingly congenital predisposition is even more marked. This is not only the case as regards hair-fetichism and fur-fetichism (see, e.g., Krafft-Ebing, *Psychopathia Sexualis*, English translation of tenth edition, pp. 233, 255, 262). In many cases of fetichisms of all kinds not only is there no record of any commencement in a definite episode (an absence which may be accounted for by the supposition that the original incident has been forgotten), but it would seem in some cases that the fetichism developed very slowly.

In this sense, it will be seen, although it is hazardous to speak of foot-fetichism as strictly an atavism, it may certainly be said to arise on a congenital basis. It represents the rare development of an inborn germ, usually latent among ourselves, which in earlier stages of civilization frequently reached a normal and general fruition.

It is of interest to emphasize this congenital element

of foot symbolism,
because more than any other forms of sexual perversion
the fetichisms are
those which are most vaguely conditioned by inborn
states of the organism
and most definitely aroused by seemingly accidental
associations or shocks
in early life. Inversion is sometimes so fundamentally
ingrained in the
individual's constitution that it arises and develops in
spite of the very
strongest influence in a contrary direction. But a
fetichism, while it
tends to occur in sensitive, nervous, timid, precocious
individuals--that
is to say, individuals of more or less neuropathic
heredity--can usually,
though not always, be traced to a definite starting
point in the shock of
some sexually emotional episode in early life.

A few examples of the influences of such association
may here be
given, referring miscellaneously to various forms of
erotic
symbolism. Magnan has recorded the case of a hair-
fetichist,
living in a district where the women wore their hair
done up, who
at the age of 15 experienced pleasurable feelings
with erection
at the sight of a village beauty combing her hair;
from that time
flowing hair became his fetich, and he could not
resist the
temptation to touch it and if possible sever it,
thus becoming a
hair-despoiler, for which he was arrested but not
sentenced.
(Archives de l'Anthropologie Criminelle, vol. v,
No. 28.)

I have elsewhere recorded the history of a boy of
14, having
already had imperfect connection with a grown-up

woman, who

associated much with a young married lady; he had no sexual

relations with her, but one day she urinated in his presence, and

he saw that her mons veneris was covered by very thick hair; from

that time he worshiped this woman in secret and acquired a

life-long fetichistic attraction to women whose pubic hair was

similarly abundant (Studies in the Psychology of Sex, vol. iii,

Appendix B, History V).

Roubaud reported the case of a general's son, sexually initiated

at the age of 14 by a blonde young lady of 21 who, in order to

avoid detection, always retained her clothing: gaiters, a corset

and a silk dress; when the boy's studies were completed and he

was sent to a garrison where he could enjoy freedom he found that

his sexual desires could only be aroused by blonde women dressed

like the lady who had first aroused his sexual desires;

consequently he gave up all thoughts of matrimony, as a woman in

nightclothes produced impotence (Traité de l'Impuissance, p.

439). Krafft-Ebing records the somewhat similar case of a nervous

Polish boy of old family seduced at the age of 17 by a French

governess, who during several months practiced mutual

masturbation with him; in this way his attention became

attracted by her very elegant boots, and in the end he became a

confirmed boot-fetichist (Psychopathia Sexualis, English

translation, p. 249).

A boy of 7, of bad heredity, was taught to masturbate by a servant girl; on one occasion she practiced this on him with her foot without taking off her shoe; it was the first time the manoeuvre gave him any pleasure, and an association was thus established which led to shoe-fetichism (Hammond, Sexual Impotence, p. 44). A government official whose first coitus in youth took place on a staircase; the sound of his partner's creaking shoes against the stairs, produced by her efforts to accelerate orgasm, formed an association which developed into an auditory shoe-fetichism; in the streets he was compelled to follow ladies whose shoes creaked, ejaculation being thus produced, while to obtain complete satisfaction he would make a prostitute, otherwise naked, sit in front of him in her shoes, moving her feet so that the shoes creaked. (Moraglia, Archivio di Psichiatria, vol. xiii, p. 568.)

Bechterew, in St. Petersburg, has recorded the case of a man who when a child used to fall asleep at the knees of his nurse with his head buried in the folds of her apron; in this position he first experienced erection and voluptuous sensations; when a youth he had no attraction to naked women, and in real life and in dreams was only excited sexually under conditions recalling his early experience; in his relations with women he

preferred

them dressed, and was excited by the rustling sound of their

skirts; in this case there was no traceable neuropathic taint nor

any other personal peculiarity. (Summarized in Journal de

Psychologie Normale et Pathologique, January-February, 1904, p.

72.)

In a curious case recorded in detail by Moll, a philologist of

sensitive temperament but sound heredity, who had always been

fond of flowers, at the age of 21 became engaged to a young lady

who wore large roses fastened in her jacket; from this time roses

became to him a sexual fetich, to kiss them caused erection, and

his erotic dreams were accompanied by visions of roses and the

hallucination of their odor; the engagement was finally broken

off and the rose-fetichism disappeared

(Untersuchungen über

Libido Sexualis, bd. i, p. 540).

Such associations may naturally occur in the early experiences of even the

most normal persons. The degree to which they will influence the

subsequent life and thought and feeling depends on the degree of the

individual's morbid emotional receptivity, on the extent to which he is

hereditarily susceptible of abnormal deviation.

Precocity is undoubtedly a

condition which favors such deviation; a child who is precociously and

abnormally sensitive to persons of the opposite sex before puberty has

established the normal channels of sexual desire, is peculiarly liable to

become the prey of a chance symbolism. All degrees of such symbolism are possible. While the average insensitive person may fail to perceive them at all, for the more alert and imaginative lover they are a fascinating part of the highly charged crystallization of passion. A more nervously exceptional person, when once such a symbolism has become firmly implanted, may find it an absolutely essential element in the charm of a beloved and charming person. Finally, for the individual who is thoroughly unsound the symbol becomes generalized; a person is no longer desired at all, being merely regarded as an appendage of the symbol, or being dispensed with altogether; the symbol is alone desired, and is fully adequate to impart by itself complete sexual gratification. While it must be considered a morbid state to demand a symbol as an almost essential part of the charm of a desired person, it is only in the final condition, in which the symbol becomes all-sufficing, that we have a true and complete perversion. In the less complete forms of symbolism it is still the woman who is desired, and the ends of procreation may be served; when the woman is ignored and the mere symbol is an adequate and even preferred stimulus to detumescence the pathological condition becomes complete.

Krafft-Ebing regarded shoe-fetichism as, in large measure, a more or less latent form of masochism, the foot or the shoe being the symbol of the subjection and humiliation which the masochist feels in the presence of the beloved object. Moll is also inclined to accept such a connection.

"The very numerous class of boot-and-shoe-fetichists," Krafft-Ebing wrote, "forms the transition to the manifestations of another independent perversion, i.e., fetichism itself; but it stands in closer relationship to the former.... It is highly probable, and shown by a correct classification of the observed cases, that the majority, and perhaps all of the cases of shoe-fetichism, rest upon a basis of more or less conscious masochistic desire for self-humiliation.... The majority or all may be looked upon as instances of latent masochism (the motive remaining unconscious) in which the _female foot or shoe, as the masochist's fetich_, has acquired an independent significance." (_Psychopathia Sexualis_, English translation of tenth edition, pp. 159, et seq.) "Though Krafft-Ebing may not have cleared up the whole matter," Moll remarks, "I regard his deductions concerning the connection of foot-and-shoe fetichism to masochism as the most important progress that has been made in the theoretic study of sexual perversions.... In any case, the connection is very frequent." (_Konträre Sexualempfindung_, third edition, p. 306.)

It is quite easy to see that this supposed identity of masochism and foot-fetichism forms a seductive theory. It is also undoubtedly true that a masochist may very easily be inclined to find in his mistress's foot an

aid to the ecstatic self-abnegation which he desires to attain.[20] But only confusion is attained by any general attempt to amalgamate masochism and foot-fetichism. In the broad sense in which erotic symbolism is here understood, both masochism and foot-fetichism may be coördinated as symbolisms; for the masochist his self-humiliating impulses are the symbol of ecstatic adoration; for the foot-fetichist his mistress's foot or shoe is the concentrated symbol of all that is most beautiful and elegant and feminine in her personality. But if in this sense they are coördinated, they remain entirely distinct and have not even any necessary tendency to become merged. Masochism merely simulates foot-fetichism; for the masochist the boot is not strictly a symbol, it is only an instrument which enables him to carry out his impulse; the true sexual symbol for him is not the boot, but the emotion of self-subjection. For the foot-fetichist, on the other hand, the foot or the shoe is not a mere instrument, but a true symbol; the focus of his worship, an idealized object which he is content to contemplate or reverently touch. He has no necessary impulse to any self-degrading action, nor any constant emotion of subjection. It may be noted that in the very typical case of foot-fetichism which is presented to us in the person of Restif de la Bretonne (*ante*, p. 18), he repeatedly speaks of "subjecting" the woman for whom he feels this fetichistic adoration, and mentions that even when still a child he especially admired a delicate and fairy-like girl in this respect because she seemed to him easier to subjugate.

Throughout life Restif's attitude toward women was active and masculine, without the slightest trace of masochism.[21]

To suppose that a fetichistic admiration of his mistress's foot is due to a lover's latent desire to be kicked, is as unreasonable as it would be to suppose that a fetichistic admiration for her hand indicated a latent desire to have his ears boxed. In determining whether we are concerned with a case of foot-fetichism or of masochism we must take into consideration the whole of the subject's mental and emotional attitude. An act, however definite, will not suffice as a criterion, for the same act in different persons may have altogether different implications. To amalgamate the two is the result of inadequate psychological analysis and only leads to confusion.

It is, however, often very difficult to decide whether we are dealing with a case which is predominantly one of masochism or of foot-fetichism. The nature of the action desired, as we have seen, will not suffice to determine the psychological character of the perversion. Krafft-Ebing believed that the desire to be trodden on, very frequently experienced by masochists, is absolutely symptomatic of masochism.[22] This is scarcely the case. The desire to be trodden on may be fundamentally an erotic symbolism, closely approaching foot-fetichism, and such slight indications of masochism as appear may be merely a parasitic growth on the symbolism, a growth perhaps more suggested by the circumstances involved in the

gratification of the abnormal desire than inherent in the innate impulse of the subject. This may be illustrated by the interesting case of a very intelligent man with whom I am well acquainted.

C.P., aged 38. Heredity good. Parents both healthy and normal.

Several children of the marriage, all sexually normal so far as is known. C.P. is the youngest of the family and separated from the others by an interval of many years. He was a seven-months' child. He has always enjoyed good health and is active and vigorous, both mentally and physically.

From the age of 9 or 10 to 14 he masturbated occasionally for the sake of physical relief, having discovered the act for himself.

He was, however, quite innocent and knew nothing of sexual matters, never having been initiated either by servants or by other boys.

"When I encounter a woman who very strongly attracts me and whom

I very greatly admire," he writes, "my desire is never that I may have sexual connection with her in the ordinary sense, but that I may lie down upon the floor on my back and be trampled upon by her. This curious desire is seldom present unless the object of my admiration is really a lady, and of fine proportions. She must be richly dressed--preferably in an evening gown, and wear dainty high-heeled slippers, either quite open so as to show the curve of the instep, or with only one strap or 'bar'

across. The skirts
should be raised sufficiently to afford me the
pleasure of seeing
her feet and a liberal amount of ankle, but in no
case above the
knee, or the effect is greatly reduced. Although I
often greatly
admire a woman's intellect and even person, sexually
no other
part of her has any serious attraction for me except
the leg,
from the knee downwards, and the foot, and these
must be
exquisitely clothed. Given this condition, my desire
amounts to a
wish to gratify my sexual sense by contact with the
(to me)
attractive part of the woman. Comparatively few
women have a leg
or foot sufficiently beautiful to my mind to excite
any serious
or compelling desire, but when this is so, or I
suspect it, I am
willing to spend any time or trouble to get her to
tread upon me
and am anxious to be trampled on with the greatest
severity.

"The treading should be inflicted for a few minutes
all over the
chest, abdomen and groin, and lastly on the penis,
which is, of
course, lying along the belly in a violent state of
erection, and
consequently too hard for the treading to damage it.
I also enjoy
being nearly strangled by a woman's foot.

"If the lady finally stands facing my head and
places her slipper
upon my penis so that the high heel falls about
where the penis
leaves the scrotum, the sole covering most of the
rest of it and
with the other foot upon the abdomen, into which I

can _see_ as
well as feel it sink as she shifts her weight from
one foot to
the other, orgasm takes place almost at once.
Emission under
these conditions is to me an agony of delight,
during which
practically the lady's whole weight should rest upon
the penis.

"One reason for my special pleasure in this method
seems to be
that first the heel and afterwards the sole of the
slipper as it
treads upon the penis greatly check the passage of
the semen and
consequently the pleasure is considerably prolonged.
There is
also a curious mental side to the affair. I love to
imagine that
the lady who is treading upon me is my mistress and
I her slave,
and that she is doing it to punish me for some
fault, or to give
herself (not me) pleasure.

"It follows that the greater the contempt and
severity with which
I am 'punished,' the greater becomes my pleasure.
The idea of
'punishment' or 'slavery' is seldom aroused except
when I have
great difficulty in accomplishing my desire and the
treader is
more than usually handsome and heavy and the
trampling
mercilessly inflicted. I have been trampled so long
and so
mercilessly several times, that I have flinched each
time the
slipper pressed its way into my aching body and have
been black
and blue for days afterwards. I take the greatest
interest in
leading ladies on to do this for me where I think I

will not

offend, and have been surprisingly successful. I must have lain beneath the feet of quite a hundred women, many of them of good social position, who would never dream of permitting any ordinary sexual intercourse, but who have been so interested or amused by the idea as to do it for me--many of them over and over again. It is perhaps needless to say that none of my own or the ladies' clothing is ever removed, or disarranged, for the accomplishment of orgasm in this manner. After a long and varied experience, I may say that my favorite weight is 10 to 11 stone, and that black, very high-heeled slippers, in combination with tan silk stockings, seem to give me the greatest pleasure and create in me the strongest desires.

"Boots, or outdoor shoes, do not attract me to anything like the same degree, although I have, upon several occasions, enjoyed myself fairly well by their use. Nude women repel me, and I find no pleasure in seeing a woman in tights. I am not averse to normal sexual connection and occasionally employ it. To me, however, the pleasure is far inferior to that of being trampled upon. I also derive keen pleasure--and usually have a strong erection--from seeing a woman, dressed as I have described, tread upon anything which yields under her foot--such as the seat of a carriage, the cushions of a punt, a footstool, etc., and I enjoy

seeing her crush flowers by treading upon them. I
have often
strolled along in the wake of some handsome lady at
a picnic or
garden party, for the pleasure of seeing the grass
upon which she
has trodden rise slowly again after her foot has
pressed it. I
delight also to see a carriage sway as a woman
leaves or enters
it--anything which needs the pressure of the foot.

"To pass now to the origin of this direction of my
feelings.

"Even in early childhood I admired pretty feminine
foot-gear, and
in the contemplation of it experienced vague
sensations which I
now recognize as sexual. When a lad of 14 or so, I
stayed a good
deal at the house of some intimate friends of my
parents, the
daughter of the house--an only child--a beautiful
and powerful
girl, about six years my senior, being my special
chum. This girl
was always daintily dressed, and having most lovely
feet and
ankles not unnaturally knew it. Whenever possible
she dressed so
as to show off their beauty to the best advantage--
rather short
skirts and usually little high-heeled slippers--and
was not
averse to showing them in a most distractingly
coquettish manner.
She seemed to have a passion for treading upon
things which would
scrunch or yield under her foot, such as flowers,
little
windfallen apples and pears, acorns, etc., or heaps
of hay, straw
or cut grass. As we wandered about the gardens--for
we were left

to do exactly as we liked--I got quite accustomed to seeing her

hunt out and tread upon such things, and used to chaff her about

it. At that time I was--as I am still--fond of lying at full

length on a thick hearthrug before a good fire. One evening as I

was lying in this way and we were alone, A. crossed the room to

reach a bangle from the mantelpiece. Instead of reaching over me,

she playfully stepped upon my body, saying that she would show me

how the hay and straw felt. Naturally I fell in with the joke and

laughed. After standing upon me a few moments she raised her

skirt slightly and, holding on to the mantelpiece for support,

stretched out one dainty foot in its brown silk stocking and

high-heeled slipper to the blaze to warm, while looking down and

laughing at my scarlet, excited face. She was a perfectly frank

and charming girl, and I feel pretty certain that, although she

evidently enjoyed my excitement and the feeling of my body

yielding under her feet, she did not on this first occasion

clearly understand my condition; nor can I remember that, though

the desire for sexual gratification drove me nearly mad, it

appeared to awaken in her any reciprocal feeling. I took hold of

her raised foot and, after kissing it, guided it by an absolutely

irresistible impulse on to my penis, which was as hard as wood

and seemed almost bursting. Almost at the moment that her weight

was thrown upon it, orgasm took place for the first

time in my
life thoroughly and effectively. No description can
give any idea
of what I felt--I only know that from that moment my
distorted
sexual focus was fixed forever. Numberless times,
after that
evening, I felt the weight of her dainty slippers,
and nothing
will ever cause the memory of the pleasure she thus
gave me to
fade. I know that A. came to enjoy treading upon me,
as much as I
enjoyed having her do it. She had a liberal dress
allowance and,
seeing the pleasure they gave me, she was always
buying pretty
stockings and ravishing slippers with the highest
and most
slender Louis heels she could find and would show
them to me with
the greatest glee, urging me to lie down that she
might try them
on me. She confessed that she loved to see and feel
them sink
into my body as she trod upon me and enjoyed the
crunch of the
muscles under her heel as she moved about. After
some minutes of
this, I always guided her slipper on to my penis,
and she would
tread carefully, but with her whole weight--probably
about 9
stone--and watch me with flashing eyes, flushed
cheeks, and
quivering lips, as she felt--as she must have done
plainly--the
throbbing and swelling of my penis under her foot as
emission
took place. I have not the smallest doubt that
orgasm took place
simultaneously with her, though we never at any time
spoke openly
of it. This went on for several years on almost
every favorable

opportunity we had, and after a month or two of separation
sometimes four or five times during a single day. Several times
during A.'s absence I masturbated by getting her slipper and
pressing it with all my strength against the penis while
imagining that she was treading upon me. The pleasure was, of
course, very inferior to her attentions. There was never at any
time between us any question of normal sexual intercourse, and we
were both well content to let things drift as they were.

"A little after 20 I went abroad, and on my return about three
years later I found her married. Although we met often, the
subject was never alluded to, though we remained firm friends. I
confess I often, when I could do so without being seen, looked
longingly at her feet and would have gladly accepted the pleasure
she could have given me by an occasional resumption of our
strange practice--but it never came.

"I went abroad again, and now neither she nor her husband are
alive and leave no issue. From time to time I have had occasional
relations with prostitutes, but always in this manner, though I
much prefer to find some lady of or above my own social position
who will do the treading for me. This is, however, interestingly
difficult.

"Out of say a hundred women (which at home and abroad is what I

should estimate must have stood upon my body) I
should say quite
80 or 85 were not prostitutes. Certainly not more
than 10 to 12
shared any sexual excitement, but while they were
evidently
excited they were not gratified. A. alone, so far as
I know, had
complete sexual satisfaction of it. I have never
asked a woman in
so many words to tread upon me for the purpose of
gratifying my
sexual desires (prostitutes excepted), but have
always tempted
them to do it in a jocular or teasing manner, and it
is very
doubtful if more than a few (married) women really
understood,
even after they had given me the extreme pleasure,
that they had
done so, because any flushing and movement on my
part under their
feet was not unnaturally put down to the trampling
to which they
were subjecting me, and it was easy for me to guide
the foot as
often as was necessary on to the penis till orgasm
took place,
and even to keep it there by laying hold of the
other one to kiss
it or on some other pretext during emission. Of
course many
understood after once doing it (most have done it
only once) what
I was at, and, although they did not ever discuss it
nor did I,
they were not unwilling to give me as many treadings
as I cared
to playfully suggest. I don't think they got any
pleasure
sexually out of it themselves, though they could see
plainly that
I did, and they did not object to give it me. I have
spent as
long as twelve months with some women working

gradually nearer

and nearer to my desire--often getting what I want
in the end,

but more often failing. I never risk it till I am
certain it

would be safe to ask it, and have never had a
serious rebuff. In

very many cases I should say the doing of what I
want has simply

been regarded by the woman as gratifying a silly and
perhaps

amusing whim, in which, beyond the novelty of
treading on a man's

body, she has taken but little interest.

"As in normal seduction, the endeavor to win the
woman over to do

what I want without arousing her antagonism is a
great part of

the charm to me, and naturally the better her social
position the

more difficult this becomes--and the more
attractive. I have

found that in three instances prostitutes have
performed the same

office for other men and knew all about it. It is
not

uninteresting to note that these three women were
all of fine,

massive build--one standing about 5 feet 10 inches
and weighing

nearly 14 stone--but with comparatively
uninteresting faces. The

weight, build and clothing count for a good deal in
exciting me.

I find that a sudden check to a man at the supreme
moment of

sexual pleasure tends to heighten and prolong the
pleasure. My

physical satisfaction is due to the fact that by
getting the lady

to stand with all her weight upon my penis (as it
lies between

her foot and the soft bed of my own body into which
it is deeply

pressed) the act of emission is enormously prolonged, with corresponding enjoyment. For this reason also I prefer a very high-heeled slipper. The seminal fluid has to be forced past two separate obstacles--the pressure of the heel close at the root of the penis and afterwards the ball of the foot which compresses the outer half, leaving a free portion between them under the arched sole of the slipper. I may add that the pleasure is greatly increased by the retention of the urine, and I always try to retain as much water as I dare. I have an unconquerable aversion to red in slippers or stockings; it will even cause impotence. Why, I know not. Strange as it may seem, although pain and bruising are often inflicted by a severe treading, I have never been in any way injured by the practice, and my pleasure in it seems not to diminish by constant repetition. The comparative difficulty of obtaining the pleasure from just the woman I want has a never-ending, if inexplicable, charm for me."

It will be observed that in this case special importance is attached to shoes with high heels, and the subject considers that the pressure of such shoes is for mechanical reasons most favorable for procuring ejaculation. Nearly all heterosexual shoe-fetichists seem, however, to be equally attracted by high heels. Restif de la Bretonne frequently referred to this point, and he gave a number of reasons for the

attractiveness of high
heels: (1) They are unlike men's boots and,
therefore, have a
sexual fascination; (2) they make the leg and foot
look more
charming; (3) they give a less bold and more sylph-
like character
to the walk; (4) they keep the feet clean. (Restif
de la
Bretonne, *Nuits de Paris*, vol. v, quoted in
Preface to his *Mes
Inscriptions*, p. ciii.) It is doubtless the first
reason--the
fact that high heels are a kind of secondary sexual
character--which is most generally potent in this
attraction.

The foregoing history, while it very distinctly brings
before us a case of
erotic symbolism, is not strictly an example of shoe-
fetichism. The
symbolism is more complex. The focus of beauty in a
desirable woman is
transferred and concentrated in the region below the
knee; in that sense
we have foot-fetichism. But the act of coitus itself is
also symbolically
transferred. Not only has the foot become the symbol of
the vulva, but
trampling has become the symbol of coitus; intercourse
takes place
symbolically *per pedem*. It is a result of this
symbolization of the foot
and of trampling that all acts of treading take on a new
and symbolical
sexual charm. The element of masochism--of pleasure in
being a woman's
slave--is a parasitic growth; that is to say, it is not
founded in the
subject's constitution, but chances to have found a
favorable soil in the
special circumstances under which his sexual life
developed. It is not
primary, but secondary, and remains an unimportant and
merely occasional

element.

It may be instructive to bring forward for comparison a case in which also we have a symbolism involving boot-fetichism, but extending beyond it. In this case there is a basis of inversion (as is not infrequent in erotic symbolisms), but from the present point of view the psychological significance of the case remains the same.

A.N., aged 29, unmarried, healthy, though not robust, and without any known hereditary taint. Has followed various avocations without taking great interest in them, but has shown some literary ability.

"I am an Englishman," his own narrative runs, "the third of three children. At my birth my father was 41 and my mother 34. My mother died of cancer when I was 15. My father is still alive, a reserved man, who still nurses his sorrow for his wife's death. I have no reason to believe my parents anything but normal and useful members of society. My sister is normal and happily married. My brother I have reason to believe to be an invert.

"A horoscope cast for me describes me in a way I think correct, and so do my friends: 'A mild, obliging, gentle, amiable person, with many fine traits of character; timid in nature, fond of society, loving peace and quietude, delighting in warm and close friendships. There is much that is firm, steadfast and

industrious, some self-love, a good deal of
diplomacy, a little
that is subtle, or what is called finesse. You are
reserved with
those you dislike. There is a serious and sad side
to your
character; you are very thoughtful and contemplative
when in
these moods. But you are not pessimistic. You have
superior
abilities, for they are intuitively intellectual.
There is a cold
reticence which restrains generous impulses and
which inclines to
acquisitiveness; it will make you deliberate,
inventive, adding
self-esteem, some vanity.'

"At an early age I was left much alone in the
nursery and there
contracted the habit of masturbation long before the
age of
puberty. I use the word 'masturbation' for want of a
better,
though it may not quite describe my case. I have
never used my
hand to the penis. As far back as I can remember I
have had what
a Frenchman has described as 'le fetichisme de la
chaussure,' and
in those early days, before I was 6 years old, I
would put on my
father's boots, taken from a cupboard at hand, and
then tying or
strapping my legs together would produce an
erection, and all the
pleasurable feelings experienced, I suppose, by
means of
masturbation. I always did this secretly, but
couldn't tell why.
I continued this practice on and off all my boyhood
and youth.
When I discovered the first emission I was much
surprised. I
always did this thing without loosening my trousers.

As to how
these feelings arose I am totally unable to say. I
can't remember
being without such feelings, and they seem to me
perfectly
normal. The sight, or even thought, of high boots,
or leggings,
especially if well polished or in patent leather,
would set all
my sexual passions aflame, and does yet. As a boy my
great desire
was to wear these things. A soldier in boots and
spurs, a groom
in tops, or even an errand-boy in patent leather
leggings,
fascinated me, and to this day, despite reason and
everything
else. The sight of such things produced an erection.
An emission
I could always produce by tightly tying my legs
together, but
only when wearing boots, and preferably leggings,
which when I
had pocket money I bought for this purpose. (At the
present
moment I have five pairs in the house and two pairs
of high
boots, quite unjustified by ordinary use.) This
habit I lapse
into yet at times. The smell of leather affects me,
but I never
know how far this may be due to association with
boots; the smell
suggests the image. Restraint by a leather strap is
more exciting
than by cords. Erotic dreams always take the form of
restraint on
the limbs when booted.

"Uniforms and liveries have a great temptation for
me, but only
when of a tight-fitting nature and smart, as
soldiers', grooms',
etc., but not sailors'; most powerfully when the
person is in

boots or leggings and breeches.

"I was a quiet, sensitive boy, taking no part in games or sports.

Have always been indifferent to them. I made few friends, but didn't want them. The craving for friendship came much later, after I was 21. I was a day boy at a private school, and never had any conversation with any boy on sexual matters, though I was dimly aware of much 'nastiness' about the school. I knew nothing of sodomy. But all these things were repulsive to me, notwithstanding my secret practices. I was a 'good boy.'

"Up to the age of 21 I was perfectly satisfied with my own

society, something of a prig, fond of books and reading, etc. I was and ever have been absolutely insensible to the influence of the other sex. I am not a woman hater, and take intellectual pleasure in the society of certain ladies, but they are nearly all much older than myself. I have a strong repulsion from sexual relations with women. I should not mind being married for the sake of companionship and for the sake of having boys of my own.

But the sexual act would frighten me. I could not in my present

frame of mind go to bed with a woman. Yet I feel an immense envy of my married friends in that they are able to give out, and find satisfaction for, their affection in a way that is quite

impossible for me. I picture certain boys in the place of the

wife.

"I am now only happy in the society of men younger than myself,
age 17 to (say) 23 or 24, youths with smooth faces, or first sign
of hair on lip, well groomed, slightly effeminate in feature, of
sympathetic, perhaps weak nature. I feel I want to help them, do
something for them, devote myself entirely to their welfare.

"With such there is no fixed line between friendship and love. I
yearn for intimacy with particular friends, but never dare
express it. I find so many people object to any strong expression
of feeling that I dare not run the risk of appearing ridiculous
in the eyes of these desired intimates.

"I have no desire for pædicatio, but the idea itself does not
repulse me or seem unnatural, though personally it repels me a
little. But I think this to be mere prejudice on my part, which
might be broken down if the loved person showed a willingness to
act a passive part. I should never dare to make an advance,
however.

"I am restrained by moral and religious considerations from
making my real feelings known, and I feel I should sink in my own
estimation if I gave way, though my natural desire is to do so.
In the face of opportunities (not I mean of pædicatio, but of
expression of excessive affection, etc.), or what might be such,

I always fail to speak lest I should forfeit the esteem of the other person. I have a feeling of surprise when any one I like evinces a liking for me. I feel that those I love are immeasurably my superiors, though my reason may tell me it is not so. I would grovel at their feet, do anything to win a smile from them, or to make them give me their company.

"Ordinary bodily contact with the boy I love gives me most exquisite pleasure, and I never lose an opportunity of bringing such contact about when it can be done naturally. I feel an immense desire to embrace, kiss, squeeze, etc., the person, to generally maul him, and say nice things--the kind of things a man usually says to a woman. A handshake, the mere presence of the person, makes me happy and content.

"I can say with the Albanian: 'If I find myself in the presence of the beloved, I rest absorbed in gazing on him. Absent, I think of nought but him. If the beloved unexpectedly appears I fall into confusion. My heart beats faster. I have eyes and ears only for the beloved.'

"I feel that my capacity of affection is finer and more spiritual than that which commonly subsists between persons of different sexes. And so, while trying to fight my instincts by religion, I find my natural feeling to be part of my religion, and its highest expression. In this sense I can speak from

experience in
my own case, and more especially in that of my
brother, that what
you have said about philanthropic activity resulting
from
repressed homosexuality is very true indeed. I can
say with one
of your female cases: 'Love is to me a religion. The
very nature
of my affection for my friends precludes the
possibility of any
element entering into it which is not absolutely
pure and
sacred.' I am, however, madly jealous. I want entire
possession,
and I can't bear for a moment that any one I do not
care for
should know the person I love.

"I am never attracted by men older than myself. The
youths who
attract me may be of any class, though preferably, I
think, of a
class a little lower than myself. I am not quite
sure of this,
however, as circumstances may have contributed more
than
deliberate choice to bring certain youths under my
notice. Those
who have exercised the most powerful influence on me
have been an
Oxford undergraduate, a barber's assistant, and a
plumber's
apprentice. Though naturally fond of intellectual
society, I do
not ask for intellect in those I love. It goes for
nothing. I
always prefer their company to that of the most
educated persons.
This preference has alienated me to some extent from
more refined
and educated circles that formerly I was intimate
with.

"I have been led entirely out of my old habits by

association

with younger friends, and now do things which before I should

never have dreamed of doing. My thoughts now are always with

certain youths, and if they speak of leaving the town, or in any

way talk of a future that I cannot share, I suffer horrid

sinkings of the heart and depression of spirits."

This case, while it concerns a person of quite different temperament, with

a more innate predisposition to specific perversions, is yet in many

respects analogous to the previous case. There is boot-fetichism; nothing

is felt to be so attractive as the foot-gear, and there is also at the

same time more than this; there is the attraction of repression and

constraint developed into a sexual symbol. In C.P.'s case that symbolism

arises from the experience of an abnormal heterosexual relationship; in

A.N.'s case it is founded on auto-erotic experiences associated with

inversion; in both alike the entire symbolism has become diffused and

generalized.

In the two cases just brought forward we have an erotic symbolism of act

founded on, and closely associated with, an erotic symbolism of object. It

may be instructive to bring forward another case in which no fetichistic

feeling toward an object can be traced, but an erotic symbolism still

clearly exists. In this case pain, even when self-inflicted, has acquired

a symbolic value as a stimulus to tumescence, without any element of

masochism. Such a case serves to indicate how the sexual attraction of

pain is really a special case of the erotic symbolism with which we are here concerned.

A.W., aged 50, a writer and lecturer, physically and mentally energetic and enjoying good health. He is, however, very emotional and of nervous temperament, but self-controlled. Though physically well developed, the sexual organs are small. He is married to an attractive woman, to whom he is much attached, and has two healthy children.

At 10 or 12 years of age he had a frequent desire to be whipped, his parents never having struck him, and on one occasion he asked a brother to go with him to the closet to get him to whip him on the posterior; but on arrival he was too shy to make the request. He did not recognize the cause of these desires, knowing nothing of such things except from the misinformation of his school-fellows' talk. As far as he can remember, he was an entirely normal, healthy boy up to the age of about 15, when his attention was arrested by an advertisement of a quack medicine for the results of "youthful excesses."

Being a city boy, he was unfamiliar with the coupling even of animals, had never had a conscious erection and did not know of frictional excitement. Experiment, however, resulted in an orgasm, and, though believing that it was wicked or at least weak and degrading, he indulged in masturbation at intervals, usually

about six times a month, and has continued even up to the present.

He had an abnormally small opening in the prepuce, making the uncovering of the glans almost impossible. (At the age of about 37, he himself slit the prepuce by three or four cuts of a scissors at intervals of about ten days. This was followed by a marked decrease in desire, especially as he shortly afterwards learned the importance of local cleanliness.) While in college at about the age of 19 he began to have nocturnal emissions occasionally and once or twice a week when at stool. Alarmed by these, he consulted a physician, who warned him of the danger, gave him bromide and prescribed cold bathing of the parts, with a hard, cool bed. These stopped the emissions.

He never had connection with women until the age of about 25, and then only three times until his marriage at 30 years of age, being deterred partly by conscientious scruples, but more by shyness and convention, and deriving very little pleasure from these instances. Even since marriage he has derived more pleasure from sexual excitement than from coitus, and can maintain erection for as long as two hours.

He has always been accustomed to torture himself in various ingenious ways, nearly always connected with sex. He would burn his skin deeply with red hot wire in inconspicuous

places. These

and similar acts were generally followed by manual
excitation

nearly always brought to a climax.

He considers that he is attracted to refined and
intellectual

women. But he is without very ardent desires, having
several

times gone to bed with attractive women who stripped
themselves

naked, but without attempting any sexual intercourse
with them.

He became interested in the "Karezza" theory and has
tried to

practice it with his wife, but could never entirely
control the
emission.

He has hired a masseur to whip him, as children are
whipped, with

a heavy dog whip, which caused pleasurable
excitement. During

this time he had relations with his wife generally
about once a

week without any great ecstasy. She was cold and
sexually slow,

owing to conventional sex repression and to an idea
that the

whole thing was "like animals" and to fear of child-
bearing,

usually necessitating the use of a cover or
withdrawal. It was

only eight years after their marriage that she
desired and

obtained a child. During these years he would often
stick pins

through his mammæ and tie them together by a string
round the

pins drawn so short as to cause great pain and then
indulge

himself in the sexual act. He used strong wooden
clips with a

tack fixed in them, so as to pierce and pinch the
mammæ, and once

he drove a pin entirely through the penis itself, then obtaining orgasm by friction. He was never able to get an automatic emission in this way, though he often tried, not even by walking briskly during an erection.

In another class of cases a purely ideal symbolism may be present by means of a fetich which acts as a powerful stimulus without itself being felt to possess any attraction. A good illustration of this condition is furnished by a case which has been communicated to me by a medical correspondent in New Zealand.

"The patient went out to South Africa as a trooper with the contingent from New Zealand, throwing up a good position in an office to do so. He had never had any trouble as regards connection with women before going out to South Africa. While in active service at the front he sustained a nasty fall from his horse, breaking his leg. He was unconscious for four days, and was then invalided down to Cape Town. Here he rapidly got well, and his accustomed health returning to him he started having what he terms 'a good time.' He repeatedly went to brothels, but was unable to have more than a temporary erection, and no ejaculation would take place. In one of these places he was in company with a drunken trooper, who suggested that they should perform the sexual act with their boots and spurs (only) on. My patient, who was also drunk, readily assented, and to his

surprise was enabled

to perform the act of copulation without any difficulty at all.

He has repeatedly tried since to perform the act without any

spurs, but is quite unable to do so; with the spurs he has no

difficulty at all in obtaining all the gratification he desires.

His general health is good. His mother was an extremely nervous

woman, and so is his sister. His father died when he was quite

young. His only other relation in the colony is a married sister,

who seems to enjoy vigorous health."

The consideration of the cases here brought forward may suffice to show

that beyond those fetichisms which find their satisfaction in the

contemplation of a part of the body or a garment, there is a more subtle

symbolism. The foot is a center of force, an agent for exerting pressure,

and thus it furnishes a point of departure not alone for the merely static

sexual fetich, but for a dynamic erotic symbolization.

The energy of its

movements becomes a substitute for the energy of the sexual organs

themselves in coitus, and exerts the same kind of fascination. The young

girl (page 35) "who seemed to have a passion for treading upon things

which would scrunch or yield under her foot," already possessed the germs

of an erotic symbolism which, under the influence of circumstances in

which she herself took an active part, developed into an adequate method

of sexual gratification.[23] The youth who was her partner learned, in the

same way, to find an erotic symbolism in all the pressure reactions of

attractive feminine feet, the swaying of a carriage
beneath their weight,
the crushing of the flowers on which they tread, the
slow rising of the
grass which they have pressed. Here we have a symbolism
which is
altogether different from that fetichism which adores a
definite object;
it is a dynamic symbolism finding its gratification in
the spectacle of
movements which ideally recall the fundamental rhythm
and pressure
reactions of the sexual process.

We may trace a very similar erotic symbolism in an
absolutely normal form.
The fascination of clothes in the lover's eyes is no
doubt a complex
phenomenon, but in part it rests on the aptitudes of a
woman's garments to
express vaguely a dynamic symbolism which must always
remain indefinite
and elusive, and on that account always possess
fascination. No one has so
acutely described this symbolism as Herrick, often an
admirable
psychologist in matters of sexual attractiveness.
Especially instructive
in this respect are his poems, "Delight in Disorder,"
"Upon Julia's
Clothes," and notably "Julia's Petticoat." "A sweet
disorder in the
dress," he tells us, "kindles in clothes a wantonness;"
it is not on the
garment itself, but on the character of its movement
that he insists; on
the "erring lace," the "winning wave" of the
"tempestuous petticoat;" he
speaks of the "liquefaction" of clothes, their "brave
vibration each way
free," and of Julia's petticoat he remarks with a more
specific symbolism
still,

"Sometimes 'twould pant and sigh and heave,

As if to stir it scarce had leave;
But having got it, thereupon,
'Twould make a brave expansion."

In the play of the beloved woman's garment, he sees the whole process of the central act of sex, with its repressions and expansions, and at the sight is himself ready to "fall into a swoon."

FOOTNOTES:

[13] G. Stanley Hall, *Adolescence*, vol. ii, p. 113. It will be noted that the hand does not appear among the parts of the body which are normally of supreme interest. An interest in the hand is by no means uncommon (it may be noted, for instance, in the course of History XII in Appendix B to vol. iii of these *Studies*), but the hand does not possess the mystery which envelops the foot, and hand-fetichism is very much less frequent than foot-fetichism, while glove-fetichism is remarkably rare. An interesting case of hand-fetichism, scarcely reaching morbid intensity, is recorded by Binet, *Etudes de Psychologie Expérimentale*, pp. 13-19; and see Krafft-Ebing, *Op. cit.*, pp. 214 et seq.

[14] *Mémoires*, vol. i, Chapter VII.

[15] Among leading English novelists Hardy shows an unusual but by no means predominant interest in the feet and shoes of his heroines; see, e.g., the observations of the cobbler in *Under the Greenwood Tree*, Chapter III. A chapter in Goethe's *Wahlverwandtschaften* (Part I, Chapter II) contains an episode involving the charm of the foot and the kissing of

the beloved's shoe.

[16] Schinz, "Philosophie des Conventions Sociales,"
_Revue
Philosophique_, June, 1903, p. 626. Mirabeau mentions in
his _Erotika
Biblion_ that modern Greek women sometimes use their
feet to provoke
orgasm in their lovers. I may add that simultaneous
mutual masturbation by
means of the feet is not unknown to-day, and I have been
told by an
English shoe-fetichist that he at one time was
accustomed to practice this
with a married lady (Brazilian)--she with slippers on
and he without--who
derived gratification equal to his own.

[17] Jacoby (loc. cit. pp. 796-7) gives a large number
of references to
Ovid's works bearing on this point. "In reading him," he
remarks, "one is
inclined to say that the psychology of the Romans was
closely allied to
that of the Chinese."

[18] R. Kleinpaul, _Sprache ohne Worte_, p. 308. See
also Moll, _Konträre
Sexualempfindung_, third edition, pp. 306-308. Bloch
brings together many
interesting references bearing on the ancient sexual and
religious
symbolism of the shoe, _Beiträge zur Ätiologie der
Psychopathia Sexualis_,
Teil II, p. 324.

[19] Jacoby (loc. cit. p. 797) appears to regard shoe-
fetichism as a true
atavism: "The sexual adoration of feminine foot-gear,"
he concludes,
"perhaps the most enigmatic and certainly the most
singular of
degenerative insanities, is thus merely a form of
atavism, the return of
the degenerate to the very ancient and primitive

psychology which we no longer understand and are no longer capable of feeling."

[20] Moll has reported in detail (*Untersuchungen über die Libido Sexualis*, bd. i, Teil II, pp. 320-324) a case which both he and Krafft-Ebing regard as illustrative of the connection between boot-fetichism and masochism. It is essentially a case of masochism, though manifesting itself almost exclusively in the desire to perform humiliating acts in connection with the attractive person's boots.

[21] Krafft-Ebing goes so far as to assert (*Psychopathia Sexualis*, English translation of tenth edition, p. 174) that "when in cases of shoe-fetichism the female shoe appears alone as the excitant of sexual desire one is justified in presuming that masochistic motives have remained latent.... Latent masochism may always be assumed as the unconscious motive." In this way he hopelessly misinterprets some of his own cases.

[22] Krafft-Ebing goes so far as to assert (*Psychopathia Sexualis*, English translation, pp. 159 and 174). Yet some of the cases he brings forward (e.g., Coxe's as quoted by Hammond) show no sign of masochism, since, according to Krafft-Ebing's own definition (p. 116), the idea of subjugation by the opposite sex is of the essence of masochism.

[23] Her actions suggest that there is often a latent sexual consciousness in regard to the feet in women, atavistic or pseudo-atavistic, and

corresponding to the sexual attraction which the feet formerly aroused, almost normally, in men. This is also suggested by the case, referred to by Shufeldt, of an unmarried woman, belonging to a family exhibiting in a high degree both erotic and neurotic traits, who had "a certain uncontrollable fascination for shoes. She delights in new shoes, and changes her shoes all day long at regular intervals of three hours each. She keeps this row of shoes out in plain sight in her apartment." (R.W. Shufeldt, "On a Case of Female Impotency," 1896, p. 10.)

III.

Scatalogic Symbolism--Urolagnia--Coprolagnia--The Ascetic Attitude Towards the Flesh--Normal basis of Scatalogic Symbolism--Scatalogic Conceptions Among Primitive Peoples--Urine as a Primitive Holy Water--Sacredness of Animal Excreta--Scatology in Folk-lore--The Obscene as Derived from the Mythological--The Immature Sexual Impulse Tends to Manifest Itself in Scatalogic Forms--The basis of Physiological Connection Between the Urinary and Genital Spheres--Urinary Fetichism Sometimes Normal in Animals--The Urolagnia of Masochists--The Scatology of Saints--Urolagnia More Often a Symbolism of Act Than a Symbolism of Object--Only Occasionally an Olfactory Fetichism--Comparative Rarity of Coprolagnia--Influence of Nates Fetichism as a Transition to Coprolagnia--Ideal Coprolagnia--Olfactory Coprolagnia--Urolagnia and

Coprolagnia as Symbols of Coitus.

We meet with another group of erotic symbolisms--alike symbolisms of object and of act--in connection with the two functions adjoining the anatomical sexual focus: the urinary and alvine excretory functions. These are sometimes termed the scatalogical group, with the two subdivisions of urolagnia and Coprolagnia.[24] *_Inter fæces et urinam nascimur_* is an ancient text which has served the ascetic preachers of old for many discourses on the littleness of man and the meanness of that reproductive power which plays so large a part in man's life. "The stupid bungle of Nature," a correspondent writes, "whereby the generative organs serve as a means of relieving the bladder, is doubtless responsible for much of the disgust which those organs excite in some minds."

At the same time, it is necessary to point out, such reflex influence may act not in one direction only, but also in the reverse direction. From the standpoint of ascetic contemplation eager to belittle humanity, the excretory centers may cast dishonor upon the genital center which they adjoin. From the more ecstatic standpoint of the impassioned lover, eager to magnify the charm of the woman he worships, it is not impossible for the excretory centers to take on some charm from the irradiating center of sex which they enclose.

Even normally such a process is traceable. The normal lover may not idealize the excretory functions of his mistress, but the fact that he

finds no repulsion in the most intimate contacts and feels no disgust at the proximity of the excretory orifices or the existence of their functions, indicates that the idealization of love has exerted at all events a neutralizing influence; indeed, the presence of an acute sensibility to the disturbing influence of this proximity of the excretory orifices and their functions must be considered abnormal; Swift's "Strephon and Chloe"--with the conviction underlying it that it is an easy matter for the excretory functions to drown the possibilities of love--could only have proceeded from a morbidly sensitive brain.[25]

A more than mere neutralizing influence, a positively idealizing influence of the sexual focus on the excretory processes adjoining it, may take place in the lover's mind without the normal variations of sexual attraction being over-passed, and even without the creation of an excretory fetichism.

Reflections of this attitude may be found in the poets. In the Song of Songs the lover says of his mistress, "Thy navel is like a round goblet, wherein no mingled wine is wanting;" in his lyric "To Dianeme," Herrick says with clear reference to the *mons veneris*:--

"Show me that hill where smiling love doth sit,
Having a living fountain under it;"

and in the very numerous poems in various languages which have more or less obscurely dealt with the rose as the

emblem of the
feminine pudenda there are occasional references to
the stream
which guards or presides over the rose. It may,
indeed, be
recalled that even in the name _nymphae_ anatomists
commonly apply
to the _labia minora_ there is generally believed to
be a poetic
allusion to the Nymphs who presided over streams,
since the
labia minora exert an influence on the direction
of the urinary
stream.

In _Wilhelm Meister_ (Part I, Chapter XV), Goethe,
on the basis
of his own personal experiences, describes his
hero's emotions in
the humble surroundings of Marianne's little room as
compared
with the stateliness and order of his own home. "It
seemed to him
when he had here to remove her stays in order to
reach the
harpsichord, there to lay her skirt on the bed
before he could
seat himself, when she herself with unembarrassed
frankness would
make no attempt to conceal from him many natural
acts which
people are accustomed to hide from others out of
decency--it
seemed to him, I say, that he became bound to her by
invisible
bands." We are told of Wordsworth (Findlay's
_Recollections of De
Quincey_, p. 36) that he read _Wilhelm Meister_ till
"he came to
the scene where the hero, in his mistress's bedroom,
becomes
sentimental over her dirty towels, etc., which
struck him with
such disgust that he flung the book out of his hand,
would never

look at it again, and declared that surely no English lady would ever read such a work." I have, however, heard a woman of high intellectual distinction refer to the peculiar truth and beauty of this very passage.

In one of his latest novels, *Les Rencontres de M. de Bréot*, Henri de Régnier, one of the most notable of recent French novelists, narrates an episode bearing on the matter before us. A personage of the story is sitting for a moment in a dark grotto during a night fête in a nobleman's park, when two ladies enter and laughingly proceed to raise their garments and accomplish a natural necessity. The man in the background, suddenly overcome by a sexual impulse, starts forward; one lady runs away, the other, whom he detains, offers little resistance to his advances. To M. de Bréot, whom he shortly after encounters, he exclaims, abashed at his own actions: "Why did I not flee? But could I imagine that the spectacle of so disgusting a function would have any other effect than to give me a humble opinion of human nature?" M. de Bréot, however, in proceeding to reproach his interlocutor for his inconsiderate temerity, observes: "What you tell me, sir, does not entirely surprise me. Nature has placed very various instincts within us, and the impulse that led you to what you have just now done is not so peculiar as you think. One may be a very estimable man and yet love women even

in what is

lowliest in their bodies." In harmony with this passage from

Régnier's novel are the remarks of a correspondent who writes to

me of the function of urination that it "appeals sexually to most

normal individuals. My own observations and inquiries prove this.

Women themselves instinctively feel it. The secrecy surrounding

the matter lends, too, I think, a sexual interest."

The fact that scatologic processes may in some degree exert an

attraction even in normal love has been especially emphasized by

Bloch (*Beiträge zur Ätiologie der Psychopathia Sexualis*, Teil

II, pp. 222, et seq.): "The man whose intellect and æsthetic

sense has been 'clouded by the sexual impulse' sees these things

in an entirely different light from him who has not been overcome

by the intoxication of love. For him they are idealized (sit

venia verbo) since they are a part of the beloved person, and in

consequence associated with love." Bloch quotes the *Memoiren*

einer Sängerin (a book which is said to be, though this seems

doubtful, genuinely autobiographical) in the same sense: "A man

who falls in love with a girl is not dragged out of his poetic

sphere by the thought that his beloved must relieve certain

natural necessities every day. It seems, indeed, to him to be

just the opposite. If one loves a person one finds nothing

obscene or disgusting in the object that pleases me." The

opposite attitude is probably in extreme cases due to the influence of a neurotic or morbidly sensitive temperament. Swift possessed such a temperament. The possession of a similar temperament is doubtless responsible for the little prose poem, "L'Extase," in which Huysmans in his first book, *Le Drageloir á Epices*, has written an attenuated version of "Strephon and Chloe" to express the disillusionment of love; the lover lies in a wood clasping the hand of the beloved with rapturous emotion; "suddenly she rose, disengaged her hand, disappeared in the bushes, and I heard as it were the rustling of rain on the leaves." His dream has fled.

In estimating the significance of the lover's attitude in this matter, it is important to realize the position which scatologic conceptions took in primitive belief. At certain stages of early culture, when all the emanations of the body are liable to possess mysterious magic properties and become apt for sacred uses, the excretions, and especially the urine, are found to form part of religious ritual and ceremonial function. Even among savages the excreta are frequently regarded as disgusting, but under the influence of these conceptions such disgust is inhibited, and those emanations of the body which are usually least honored become religious symbols.

Urine has been regarded as the original holy water, and many customs which still survive in Italy and various

parts of Europe,
involving the use of a fluid which must often be
yellow and
sometimes salt, possibly indicate the earlier use of
urine. (The
Greek water of aspersion, according to Theocritus,
was mixed
with salt, as is sometimes the modern Italian holy
water. J.J.
Blunt, *Vestiges of Ancient Manners and Customs*, p.
173.) Among
the Hottentots, as Kolbein and others have recorded,
the medicine
man urinated alternately on bride and bridegroom,
and a
successful young warrior was sprinkled in the same
way. Mungo
Park mentions that in Africa on one occasion a bride
sent a bowl
of her urine which was thrown over him as a special
mark of honor
to a distinguished guest. Pennant remarked that the
Highlanders
sprinkled their cattle with urine, as a kind of holy
water, on
the first Monday in every quarter. (Bourke,
Scatalogic Rites,
pp. 228, 239; Brand, *Popular Antiquities*, "Bride-
Ales.")

Even the excreta of animals have sometimes been
counted sacred.
This is notably so in the case of the cow, of all
animals the
most venerated by primitive peoples, and especially
in India.
Jules Bois (*Visions de l'Inde*, p. 86) describes
the spectacle
presented in the temple of the cows at Benares: "I
put my head
into the opening of the holy stables. It was the
largest of
temples, a splendor of precious stones and marble,
where the
venerated heifers passed backwards and forwards. A

whole people

adored them. They take no notice, plunged in their divine and

obscure unconsciousness. And they fulfil with serenity their

animal functions; they chew the offerings, drink water from

copper vessels, and when they are filled they relieve themselves.

Then a stercoraceous and religious insanity overcomes these

starry-faced women and venerable men; they fall on their knees,

prostrate themselves, eat the droppings, greedily drink the

liquid, which for them is miraculous and sacred."

(Cf. Bourke,

Scatalogic Rites, Chapter XVII.)

Among the Chevsurs of the Caucasus, perhaps an Iranian people, a

woman after her confinement, for which she lives apart, purifies

herself by washing in the urine of a cow and then returns home.

This mode of purification is recommended in the Avesta, and is

said to be used by the few remaining followers of this creed.

We have not only to take into account the frequency with which among

primitive peoples the excretions possess a religious significance. It is

further to be noted that in the folk-lore of modern Europe we everywhere

find plentiful evidence of the earlier prevalence of legends and practices

of a scatalogical character. It is significant that in the majority of

cases it is easy to see a sexual reference in these stories and customs.

The legends have lost their earlier and often mythical significance, and

frequently take on a suggestion of obscenity, while the

scatalogical
practices have become the magical devices of lovelorn
maidens or forsaken
wives practiced in secrecy. It has happened to
scatalogical rites to be
regarded as we may gather from the Clouds of
Aristophanes, that the
sacred leathern phallus borne by the women in the
Bacchanalia was becoming
in his time, an object to arouse the amusement of little
boys.

Among many primitive peoples throughout the world,
and among the
lower social classes of civilized peoples, urine
possesses magic
properties, more especially, it would seem, the
urine of women
and that of people who stand, or wish to stand, in
sexual
relationship to each other. In a legend of the
Indians of the
northwest coast of America, recorded by Boas, a
woman gives her
lover some of her urine and says: "You can wake the
dead if you
drop some of my urine in their ears and nose."
(Zeitschrift für
Ethnologie, 1894, Heft IV, p. 293.) Among the same
Indians there
is a legend of a woman with a beautiful white skin
who found on
bathing every morning in the river that the fish
were attracted
to her skin and could not be driven off even by
magical
solutions. At last she said to herself: "I will make
water on
them and then they will leave me alone." She did so,
and
henceforth the fish left her. But shortly after fire
came from
Heaven and killed her. (Ib., 1891, Heft V, p. 640.)
Among both
Christians and Mohammedans a wife can attach an

unfaithful

husband by privately putting some of her urine in his drink. (B.

Stern, *Medizin in der Türkei*, vol. ii, p. 11.)

This practice is

world-wide; thus among the aborigines of Brazil, according to

Martius, the urine and other excretions and secretions are potent

for aphrodisiacal objects. (Bourke's *Scatalogic Rites of All*

Nations contains many references to the folk-lore practices in

this matter; a study of popular beliefs in the magic power of

urine, published in Bombay by Professor Eugen Wilhelm in 1889, I

have not seen.)

The legends which narrate scatalogic exploits are numerous in the

literature of all countries. Among primitive peoples they often

have a purely theological character, for in the popular

mythologies of all countries (even, as we learn from Aristophanes, among the Greeks) natural phenomena such as the

rain, are apt to be regarded as divine excretions, but in course

of time the legends take on a more erotic or a more obscene

character. In the Irish *Book of Leinster* (written down

somewhere about the twelfth century, but containing material of

very much older date) we are told how a number of princesses in

Emain Macha, the seat of the Ulster Kings, resolved to find out

which of them could by urinating on it melt a snow pillar which

the men had made, the woman who succeeded to be regarded as the

best among them. None of them succeeded, and they

sent for

Derbforgaill, who was in love with Cuchullain, and she was able

to melt the pillar; whereupon the other women, jealous of the

superiority she had thus shown, tore out her eyes.

(Zimmer,

"Keltische Beiträge," *_Zeitschrift für Deutsche Alterthum_*, vol.

xxxii, Heft II, pp. 216-219.) Rhys considers that Derbforgaill

was really a goddess of dawn and dusk, "the drop glistening in

the sun's rays," as indicated by her name, which means a drop or

tear. (J. Rhys, *_Lectures on the Origin and Growth of Religion as*

Illustrated by Celtic Heathendom_, p. 466.) It is interesting to

compare the legend of Derbforgaill with a somewhat more modern

Picardy folk-lore *_conte_* which is clearly analogous but no

longer seems to show any mythologic element, "La Princesse qui

pisse par dessus les Meules." This princess had a habit of

urinating over hay-cocks; the king, her father, in order to break

her of the habit, offered her in marriage to anyone who could

make a hay-cock so high that she could not urinate over it. The

young men came, but the princess would merely laugh and at once

achieve the task. At last there came a young man who argued with

himself that she would not be able to perform this feat after she

had lost her virginity. He therefore seduced her first and she

then failed ignobly, merely wetting her stockings. Accordingly,

she became his bride. (Kryptadia, vol. i. p. 333.) Such legends,

which have lost any mythologic elements they may originally have possessed and have become merely _contes_, are not uncommon in the folk-lore of many countries. But in their earlier more religious forms and in their later more obscene forms, they alike bear witness to the large place which scatalogic conceptions play in the primitive mind.

It is a notable fact in evidence of the close and seemingly normal association with the sexual impulse of the scatalogic processes, that an interest in them, arising naturally and spontaneously, is one of the most frequent channels by which the sexual impulse first manifests itself in young boys and girls.

Stanley Hall, who has made special inquiries into the matter, remarks that in childhood the products of excretion by bladder and bowels are often objects of interest hardly less intense for a time than eating and drinking. ("Early Sense of Self," American Journal of Psychology, April, 1898, p. 361.)

"Micturitional obscenities," the same writer observes again, "which our returns show to be so common before adolescence, culminate at 10 or 12, and seem to retreat into the background as sex phenomena appear." They are, he remarks, of two classes: "Fouling persons or things, secretly from adults, but openly with each other," and less often "ceremonial acts connected with the act or the product that almost suggest the

scatalogical rites of savages, unfit for description here, but of great interest and importance." (G. Stanley Hall, Adolescence, vol. i, p. 116.)

The nature of such scatalogical phenomena in childhood--which are often clearly the instinctive manifestations of an erotic symbolism--and their wide prevalence among both boys and girls, are very well illustrated in a narrative which I include in Appendix B, History II.

In boys as they approach the age of puberty, this attraction to the scatalogic, when it exists, tends to die out, giving place to more normal sexual conceptions, or at all events it takes a subordinate and less serious place in the mind. In girls, on the other hand, it often tends to persist. Edmond de Goncourt, a minute observer of the feminine mind, refers in Chérie to "those innocent and triumphant gaieties which scatalogic stories have the privilege of arousing in women who have remained still children, even the most distinguished women." The extent to which innocent young women, who would frequently be uninterested or repelled in presence of the sexually obscene are sometimes attracted by the scatalogically obscene, becomes intelligible, however, if we realize that a symbolism comes here into play. In women the more specifically sexual knowledge and experience of life frequently develop much later than in men or even remains in abeyance, and the specifically sexual phenomena cannot therefore easily lend themselves to wit, or humor, or imagination.

But the scatologic sphere, by the very fact that in women it is a specially intimate and secret region which is yet always liable to be unexpectedly protruded into consciousness, furnishes an inexhaustible field for situations which have the same character as those furnished by the sexually obscene. It thus happens that the sexually obscene which in men tends to overshadow the scatologically obscene, in women--partly from inexperience and partly, it is probable, from their almost physiological modesty--plays a part subordinate to the scatological. In a somewhat analogous way scatological wit and humor play a considerable part in the work of various eminent authors who were clergymen or priests.

In addition to the anatomical and psychological associations which contribute to furnish a basis on which erotic symbolisms may spring up, there are also physiological connections between the genital and urinary spheres which directly favor such symbolisms. In discussing the analysis of the sexual impulse in a previous volume of these Studies, I have pointed out the remarkable relationship--sometimes of transference, sometimes of compensation--which exists between genital tension and vesical tension, both in men and women. In the histories of normal sexual development brought together at the end of that and subsequent volumes the relationship may frequently be traced, as also in the case of C.P. in the present study (p. 37). Vesical power is also commonly believed to be in relation with sexual potency, and the inability to project the urinary

stream in a normal manner is one of the accepted signs of sexual impotency.[26] Féré, again, has recorded the history of a man with periodic crises of sexual desire, and subsequently sexual obsession without desire, which were always accompanied by the impulse to urinate and by increased urination.[27] In the case, recorded by Pitres and Régis, of a young girl who, having once at the sight of a young man she liked in a theater been overcome by sexual feeling accompanied by a strong desire to urinate, was afterward tormented by a groundless fear of experiencing an irresistible desire to urinate at inconvenient times,[28] we have an example of what may be called a physiological scatalogic symbolism of sex, an emotion which was primarily erotic becoming transferred to the bladder and then remaining persistent. From such a physiological symbolism it is but a step to the psychological symbolisms of scatalogic fetichism.

It is worthy of note, as an indication that such phenomena are scarcely abnormal, that a urinary symbolism, and even a strictly sexual fetichism, are normal among many animals.

The most familiar example of this kind is furnished by the dog, who is sexually excited in this manner by traces of the bitch and himself takes every opportunity of making his own path recognizable. "This custom," Espinas remarks (*Des Sociétés Animales*, p. 228), "has no other aim than to spread along the road recognizable traces of their presence for the benefit of

individuals of the other sex, the odor of these traces doubtless causing excitement."

It is noteworthy, also, that in animals as well as in man, sexual excitement may manifest itself in the bladder. Thus Daumas states

(Chevaux de Sahara, p. 49) that if the mare urinates when she hears the stallion neigh it is a sign that she is ready for connection.

It is in masochism, or passive algolagnia, that we may most frequently find scatologic symbolism in its fully developed form. The man whose predominant impulse is to subjugate himself to his mistress and to receive at her hands the utmost humiliation, frequently finds the climax of his gratification in being urinated on by her, whether in actual fact or only in imagination.

In many such cases, however, it is evident that we have a mixed phenomenon; the symbolism is double. The act becomes desirable because it is the outward and visible sign of an inwardly experienced abject slavery to an adored person. But it is also desirable because of intimately sexual associations in the act itself, as a symbolical detumescence, a simulacrum of the sexual act, and one which proceeds from the sexual focus itself.

Krafft-Ebing records various cases of masochism in which the emission of urine on to the body or into the mouth formed the climax of sexual gratification, as, for instance (Psychopathia

Sexualis_, English translation, p. 183) in the case of a Russian official who as a boy had fancies of being bound between the thighs of a woman, compelled to sleep beneath her nates and to drink her urine, and in later life experienced the greatest excitement when practicing the last part of this early imagination.

In another case, recorded by Krafft-Ebing and by him termed "ideal masochism" (_Op. cit._, pp. 127-130), the subject from childhood indulged in voluptuous day-dreams in which he was the slave of a beautiful mistress who would compel him to obey all her caprices, stand over him with one foot on his breast, sit on his face and body, make him wait on her in her bath, or when she urinated, and sometimes insist on doing this on his face; though a highly intellectual man, he was always too timid to attempt to carry any of his ideas into execution; he had been troubled by nocturnal enuresis up to the age of 20.

Neri, again (_Archivio delle Psicopatie Sessuali_, vol. i, fasc. 7 and 8, 1896), records the case of an Italian masochist who experienced the greatest pleasure when both urination and defecation were practiced in this manner by the woman he was attached to.

In a previous volume of these _Studies_ ("Sexual Inversion," History XXVI) I have recorded the masochistic day-

dreams of a boy
whose impulses were at the same time inverted; in
his reveries
"the central fact," he states, "became the discharge
of urine
from my lover over my body and limbs, or, if I were
very fond of
him, I let it be in my face." In actual life the act
of urination
casually witnessed in childhood became the symbol,
even the
reality, of the central secret of sex: "I stood
rooted and
flushing with downcast eyes till the act was over,
and was
conscious for a considerable time of stammering
speech and
bewildered faculties.... I was overwhelmed with
emotion and could
barely drag my feet from the spot or my eyes from
the damp
herbage where he had deposited the waters of
secrecy. Even to-day
I cannot dissociate myself from the shuddering charm
that moment
had for me."

It is not only the urine and the faeces which may thus
acquire a symbolic
fascination and attractiveness under the influence of
masochistic
deviations of sexual idealization. In some cases extreme
rapture has been
experienced in licking sweating feet. There is, indeed,
no excretion or
product of the body which has not been a source of
ecstasy: the sweat from
every part of the body, the saliva and menstrual fluid,
even the wax from
the ears.

Krafft-Ebing very truly points out (Psychopathia
Sexualis,
English translation, p. 178) that this sexual
scatalogic

symbolism is precisely paralleled by a religious scatalogic symbolism. In the excesses of devout enthusiasm the ascetic performs exactly the same acts as are performed in these excesses of erotic enthusiasm. To mix excreta with the food, to lick up excrement, to suck festering sores--all these and the like are acts which holy and venerated women have performed.

Not only the saint, but also the prophet and medicine-man have been frequently eaters of human excrement; it is only necessary to refer to the instance of the prophet Ezekiel, who declared that he was commanded to bake his bread with human dung, and to the practices of medicine-men at Torres Straits, in whose training the eating of human excrement takes a recognized part.

(Deities, notably Baal-Phegor, were sometimes supposed to eat excrement, so that it was natural that their messengers and representatives among men should do so. As regards Baal-Phegor, see Dulaure, *_Des Divinités Génératrices_*, Chapter IV, and J.G. Bourke, *_Scatalogic Rites of All Nations_*, p. 241. See also Ezekiel, Chapter IV, v. 12, and *_Reports Anthropological Expedition to Torres Straits_*, vol. v, p. 321.)

It must be added, however, that while the masochist is overcome by sexual rapture, so that he sees nothing disgusting in his act, the medicine-man and the ascetic are not so invariably overcome by religious rapture, and several ascetic writers

have referred

to the horror and disgust they experienced, at all events at

first, in accomplishing such acts, while the medicine-men when

novices sometimes find the ordeal too severe and have to abandon

their career. Brénier de Montmorand, while remarking, not without

some exaggeration, that "the Christian ascetics are almost all

eaters of excrement" ("Ascétisme et Mysticisme," Revue

Philosophique, March, 1904, p. 245), quotes the testimonies of

Marguerite-Marie and Madame Guyon as to the extreme repugnance

which they had to overcome. They were impelled by a merely

intellectual symbolism of self-mortification rather than by the

profoundly felt emotional symbolism which moves the masochist.

Coprophagic acts, whether under the influences of religious

exaltation or of sexual rapture, inevitably excite our disgust.

We regard them as almost insane, fortified in that belief by the

undoubted fact that coprophagia is not uncommon among the insane.

It may, therefore, be proper to point out that it is not so very

long since the ingestion of human excrement was carried out by

our own forefathers in the most sane and deliberate manner. It

was administered by medical practitioners for a great number of

ailments, apparently with entirely satisfactory results. Less

than two centuries ago, Schurig, who so admirably gathered

together and arranged the medical lore of his own

and the immediately preceding ages, wrote a very long and detailed chapter, "De Stercoris Humani Usu Medico" (*Chylologia*, 1725, cap. XIII; in the Paris *Journal de Médecine* for February 19, 1905, there appeared an article, which I have not seen, entitled "Médicaments oubliées: l'urine et la fiente humaine.") The classes of cases in which the drug was found beneficial would seem to have been extremely various. It must not be supposed that it was usually ingested in the crude form. A common method was to take the faeces of boys, dry them, mix them with the best honey, and administer an electuary. (At an earlier period such drugs appear to have met with some opposition from the Church, which seems to have seen in them only an application of magic; thus I note that in Burchard's remarkable Penitential of the fourteenth century, as reproduced by Wasserschleben, 40 days' penance is prescribed for the use of human urine or excrement as a medicine. Wasserschleben *Die Bussordnungen der Abendländlichen Kirche*, p. 651.)

The urolagnia of masochism is not a simple phenomenon; it embodies a double symbolism: on the one hand a symbolism of self-abnegation, such as the ascetic feels, on the other hand a symbolism of transferred sexual emotion. Krafft-Ebing was disposed to regard all cases in which a scatological sexual attraction existed as due to "latent masochism." Such

a point of view is quite untenable. Certainly the connection is common, but in the majority of cases of slightly marked scatological fetichism no masochism is evident. And when we bear in mind the various considerations, already brought forward, which show how widespread and clearly realized is the natural and normal basis furnished for such symbolism, it becomes quite unnecessary to invoke any aid from masochism. There is ample evidence to show that, either as a habitual or more usually an occasional act, the impulse to bestow a symbolic value on the act of urination in a beloved person, is not extremely uncommon; it has been noted of men of high intellectual distinction; it occurs in women as well as men; when existing in only a slight degree, it must be regarded as within the normal limits of variation of sexual emotion.

The occasional cases in which the urine is drunk may possibly suggest that the motive lies in the properties of the fluid acting on the system. Support for this supposition might be found in the fact that urine actually does possess, apart altogether from its magic virtues embodied in folk-lore, the properties of a general stimulant. In composition (as Masterman first pointed out) "beef-tea differs little from healthy urine," containing exactly the same constituents, except that in beef-tea there is less urea and uric acid. Fresh urine--more especially that of children and young women--is taken as a medicine in nearly all parts of the world for various disorders, such as

epistaxis,
malaria and hysteria, with benefit, this benefit
being almost
certainly due to its qualities as a general
stimulant and
restorative. William Salmon's *_Dispensatory_*, 1678
(quoted in
British Medical Journal, April 21, 1900, p. 974),
shows that in
the seventeenth century urine still occupied an
important place
as a medicine, and it frequently entered largely
into the
composition of Aqua Divina.

Its use has been known even in England in the
nineteenth century.
(Masterman, *_Lancet_*, October 2, 1880; R. Neale,
"Urine as a
Medicine," *_Practitioner_*, November, 1881; Bourke
brings together
a great deal of evidence as to the therapeutic uses
of urine in
his *_Scatalogic Rites_*, especially pp. 331-335;
Lusini has shown
that normal urine invariably increases the frequency
of the heart
beats, *_Archivio di Farmacologia_*, fascs. 19-21,
1893.)

But it is an error to suppose that these facts
account for the
urolagnic drinking of urine. As in the gratification
of a normal
sexual impulse, the intense excitement of gratifying
a scatalogic
sexual impulse itself produces a degree of emotional
stimulation
far greater than the ingestion of a small amount of
animal
extractives would be adequate to effect. In such
cases, as much
as in normal sexuality, the stimulation is clearly
psychic.

When, as is most commonly the case, it is the process of urination and not the urine itself which is attractive, we are clearly concerned with a symbolism of act and not with the fetichistic attraction of an excretion. When the excretion, apart from the act, provides the attraction, we seem usually to be in the presence of an olfactory fetichism. These fetichisms connected with the excreta appear to be experienced chiefly by individuals who are somewhat weak-minded, which is not necessarily the case in regard to those persons for whom the act, rather than its product apart from the beloved person, is the attractive symbol.

The sexually symbolic nature of the act of urination for many people is indicated by the existence, according to Bloch, who enumerates various kinds of indecent photographs, of a group which he terms "the notorious _pisseuses_." It is further indicated by several of the reproductions in Fuch's _Erotsiche Element in der Karikatur_, such as Delorme's "La Necessitê n'a point de Loi." (It should be added that such a scene by no means necessarily possesses any erotic symbolism, as we may see in Rembrandt's etching commonly called "Le Femme qui Pisse," in which the reflected lights on the partly shadowed stream furnish an artistic motive which is obviously free from any trace of obscenity.) In the case which Krafft-Ebing quotes from Maschka of a young man who would induce young girls to dance naked in his room, to leap, and to urinate in his presence,

whereupon seminal

ejaculation would take place, we have a typical example of urolagnic symbolism in a form adequate to produce complete gratification. A case in which the urolagnic form of scatologic symbolism reached its fullest development as a sexual perversion has been described in Russia by Sukhanoff (summarized in Archives d'Anthropologie Criminelle, November, 1900, and Annales Medico-psychologiques, February, 1901), that of a young man of 27, of neuropathic temperament, who when he once chanced to witness a woman urinating experienced voluptuous sensations.

From that moment he sought close contact with women urinating, the maximum of gratification being reached when he could place himself in such a position that a woman, in all innocence, would urinate into his mouth. All his amorous adventures were concerned with the search for opportunities for procuring this difficult gratification. Closets in which he was able to hide, winter weather and dull days he found most favorable to success. (A somewhat similar case is recorded in the Archives de Neurologie, 1902, p. 462.)

In the case of a robust man of neuropathic heredity recorded by Pelanda some light is shed on the psychic attitude in these manifestations; there was masturbation up to the age of 16, when he abandoned the practice, and up to the age of 30 found complete

satisfaction in drinking the still hot urine of women. When a lady or girl in the house went to her room to satisfy a need of this kind, she had hardly left it but he hastened in, overcome by extreme excitement, culminating in spontaneous ejaculation. The younger the woman the greater the transport he experienced. It is noteworthy that in this, as possibly in all similar cases, there was no sensory perversion and no morbid attraction of taste or smell; he stated that the action of his senses was suspended by his excitement, and that he was quite unable to perceive the odor or taste of the fluid. (Pelanda, "Pornopaticice," Archivio di Psichiatria, fasc. iii-iv, 1889, p. 356.) It is in the emotional symbolism that the fascination lies and not in any sensory perversion.

Magnan records the spontaneous development of this sexual symbolism in a girl of 11, of good intellectual development but alcoholic heredity, who seduced a boy younger than herself to mutual masturbation, and on one occasion, lying on the ground and raising her clothes, asked him to urinate on her. (International Congress of Criminal Anthropology, 1889.) This case (except for the early age of the subject) illustrates sporadically occurring urolagnic symbolism in a woman, to whom such symbolism is fairly obvious on account of the close resemblance between the emission of urine and the ejaculation of semen in the man,

and the fact
that the same conduit serves for both fluids. (A
urolagnic
day-dream of this kind is recorded in the history of
a lady
contained in the third volume of these Studies,
Appendix B,
History VIII.) The natural and inevitable character
of this
symbolism is shown by the fact that among primitive
peoples urine
is sometimes supposed to possess the fertilizing
virtues of
semen. J.G. Frazer in his edition of Pausanias (vol.
iv, p. 139)
brings together various stories of women impregnated
by urine.
Hartland also (Legend of Perseus, vol. i, pp. 76,
92) records
legends of women who were impregnated by
accidentally or
intentionally drinking urine.

The symbolic sexual significance of urolagnia has
hitherto
usually been confused with the fetichistic and
mainly olfactory
perversion by which the excretion itself becomes a
source of
sexual excitement. Long since Tardieu referred,
under the name of
"renifleurs," to persons who were said to haunt the
neighborhood
of quiet passages, more especially in the
neighborhood of
theatres, and who when they perceived a woman emerge
after
urination, would hasten to excite themselves by the
odor of the
excretion. Possibly a fetichism of this kind existed
in a case
recorded by Belletrud and Mercier (Annales
d'Hygiène Publique,
June, 1904, p. 48). A weak-minded, timid youth, who
was very

sexual but not attractive to women, would watch for women who

were about to urinate and immediately they had passed on would go

and lick the spot they had moistened, at the same time

masturbating. Such a fetichistic perversion is strictly analogous

to the fetichism by which women's handkerchiefs, aprons or

underlinen become capable of affording sexual gratification. A

very complete case of such urolagnic fetichism--complete because

separated from association with the person accomplishing the act

of urination--has been recorded by Moraglia in a woman. It is the

case of a beautiful and attractive young woman of 18, with thick

black hair, and expressive vivacious eyes, but sallow complexion.

Married a year previously, but childless, she experienced a

certain amount of pleasure in coitus, but she preferred

masturbation, and frankly acknowledged that she was highly

excited by the odor of fermented urine. So strong was this

fetichism that when, for instance, she passed a street urinal she

was often obliged to go aside and masturbate; once she went for

this purpose into the urinal itself and was almost discovered in

the act, and on another occasion into a church. Her perversion

caused her much worry because of the fear of detection. She

preferred, when she could, to obtain a bottle of urine--which

must be stale and a man's (this, she said, she could detect by

the smell)--and to shut herself up in her own room,

holding the

bottle in one hand and repeatedly masturbating with the other.

(Moraglia, "Psicopatie Sessuali," Archivio di Psichiatria, vol.

xiii, fasc. 6, p. 267, 1892.) This case is of especial interest

because of the great rarity of fully developed fetichism in

women. In a slight and germinal degree I believe that cases of

fetichism are not uncommon in women, but they are certainly rare

in a well-marked form, and Krafft-Ebing declared, even in the

late editions of his Psychopathia Sexualis, that he knew of no

cases in women.

So far we have been concerned with the urolagnic rather than the

coprolagnic variety of scatological symbolism. Although the two are

sometimes associated there is no necessary connection, and most usually

there is no tendency for the one to involve the other. Urolagnia is

certainly much the more frequently found; the act of urination is far more

apt to suggest erotically symbolical ideas than the idea of defecation.

It is not difficult to understand why this should be so.

The act of

urination lends itself more easily to sexual symbolism; it is more

intimately associated with the genital function; its repetition is

necessary at more frequent intervals so that it is more in evidence;

moreover, its product, unlike that of the act of defecation, is not

offensive to the senses. Still coprolagnia occurs and not so very

infrequently. Burton remarked that even the normal lover is affected by

this feeling: "immo nec ipsum amicæ stercus foetet."[29]

Of Caligula who, however, was scarcely sane, it was said "et quidem stercus uxoris degustavit."[30] In Parisian brothels (according to Taxil and others) provision is made for those who are sexually excited by the spectacle of the act of defecation (without reference to contact or odor) by means of a "tabouret de verre," from under the glass floor of which the spectacle of the defecating women may be closely observed. It may be added that the erotic nature of such a spectacle is referred to in the Marquis de Sade's novels.

There is one motive for the existence of coprolagnia which must not be passed over, because it has doubtless frequently served as a mode of transition to what, taken by itself, may well seem the least æsthetically attractive of erotic symbols. I refer to the tendency of the nates to become a sexual fetich. The nates have in all ages and in all parts of the world been frequently regarded as one of the most æsthetically beautiful parts of the feminine body.[31] It is probable that on the basis of this entirely normal attraction more than one form of erotic symbolism is at all events in part supported. Dühren and others have considered that the æsthetic charm of the nates is one of the motives which prompt the desire to inflict flagellation on women. In the same way-- certainly in some and probably in many cases--the sexual charm of the nates progressively extends to the anal region, to the act of defecation, and finally to the feces.

In a case of Krafft-Ebing's (Op. cit., p. 183) the subject,
when a child of 6, accidentally placed his hand in contact with
the nates of the little girl who sat next to him in school, and
experienced so great a pleasure in this contact that he
frequently repeated it; when he was 10 a nursery governess, to
gratify her own desires, placed his finger in her vagina; in
adult life he developed urolagnic tendencies.

In a case of Moll's the development of a youthful admiration for
the nates in a coprolagnic direction may be clearly traced. In
this case a young man, a merchant, in a good position, sought to
come in contact with women defecating; and with this object would
seek to conceal himself in closets; the excretal odor was
pleasurable to him, but was not essential to gratification, and
the sight of the nates was also exciting and at the same time not
essential to gratification; the act of defecation appears,
however, to have been regarded as essential. He never sought to
witness prostitutes in this situation; he was only attracted to
young, pretty and innocent women. The coprolagnia here, however,
had its source in a childish impression of admiration for the
nates. When 5 or 6 years old he crawled under the clothes of a
servant girl, his face coming in contact with her nates, an
impression that remained associated in his mind with pleasure.

Three or four years later he used to experience much pleasure when a young girl cousin sat on his face; thus was strengthened an association which developed naturally into coprolagnia. (Moll, Untersuchungen über die Libido Sexualis, bd. i, p. 837.)

It is scarcely necessary to remark that an admiration for the nates, even when reaching a fetichistic degree, by no means necessarily involves, even after many years, any attraction to the excreta. A correspondent for whom the nates have constituted a fetich for many years writes: "I find my craving for women with profuse pelvic or posterior development is growing and I wish to copulate from behind; but I would feel a sickening feeling if any part of my person came in contact with the female anus. It is more pleasing to me to see the nates than the mons, yet I loathe everything associated with the anal region."

Moll has recorded in detail a case of what may be described as "ideal coprolagnia"--that is to say, where the symbolism, though fully developed in imagination, was not carried into real life--which is of great interest because it shows how, in a very intelligent subject, the deviated symbolism may become highly developed and irradiate all the views of life in the same way as the normal impulse. (The subject's desires were also inverted, but from the present point of view the psychological interest of the case is not thereby impaired.) Moll's case was one of symbolism of

act, the excreta offering no attraction apart from the process of defecation. In a case which has been communicated to me there was, on the other hand, an olfactory fetichistic attraction to the excreta even in the absence of the person.

In Moll's case, the patient, X., 23 years of age, belongs to a family which he himself describes as nervous. His mother, who is anæmic, has long suffered from almost periodical attacks of excitement, weakness, syncope and palpitation. A brother of the mother died in a lunatic asylum, and several other brothers complain much of their nerves. The mother's sisters are very good-natured, but liable to break out in furious passions; this they inherit from their father. There appears to be no nervous disease on the patient's father's side. X.'s sisters are also healthy.

X. himself is of powerful undersized build and enjoys good health, injured by no excesses. He considers himself nervous. He worked hard at school and was always the first in his class; he adds, however, that this is due less to his own abilities than the laziness of his school-fellows. He is, as he remarks, very religious and prays frequently, but seldom goes to church.

In regard to his psychic characters he says that he has no specially prominent talent, but is much interested in languages,

mathematics, physics and philosophy, in fact, in abstract subjects generally. "While I take a lively interest in every kind of intellectual work," he says, "it is only recently that I have been attracted to real life and its requirements. I have never had much skill in physical exercises. For external things until recently I have only had contempt. I have a delicately constituted nature, loving solitude, and only associating with a few select persons. I have a decided taste for fiction, poetry and music; my temperament is idealistic and religious, with strict conceptions of duty and morality, and aspirations towards the good and beautiful. I detest all that is common and coarse, and yet I can think and act in the way you will learn from the following pages."

Regarding his sexual life, X. made the following communication:

"During the last two years I have become convinced of the perversion of my sexual instinct. I had often previously thought that in me the impulse was not quite normal, but it is only lately that I have become convinced of my complete perversion. I have never read or heard of any case in which the sexual feelings were of the same kind. Although I can feel a lively inclination towards superior representatives of the female sex, and have twice felt something like love, the sight or the recollection even of a beautiful woman have never caused sexual

excitement."

In the two exceptional instances mentioned it appears that X. had an inclination to kiss the women in question, but that the thought of coitus had no attraction. "In my voluptuous dreams, connected with the emission of semen, women in seductive situations have never appeared. I have never had any desire to visit a puella publica. The love-stories of my fellow-students seemed very silly, dances and balls were a horror to me, and only on very rare occasions could I be persuaded to go into society. It will be easy to guess the diagnosis in my case: I suffer from the sexual attraction of my own sex, I am a lover of boys.

"You cannot imagine what a world of thoughts, wishes, feelings and impulses the words 'knabe,' 'pais,' 'garcon,' 'boy,' 'ragazzo' have for me; one of these words, even in an unmeaning clause of a translation-book, calls before me the whole sum of associations which in course of time have become bound up with this idea, and it is only with an effort that I can scare away the wild band. This group of thoughts shows a wonderful mixture of warm sensuality and ideal love, it unites my lowest and highest impulses, the strength and the weakness of my nature, my curse and my blessing. My inclination is especially towards boys of the age of 12 to 15; though they may be rather younger or older. That I should prefer beautiful and

intelligent boys is
comprehensible. I do not want a prostitute, but a
friend or a
son, whose soul I love, whom I can help to become a
more perfect
man, such as I myself would willingly be.

"When I myself belonged to that happy age (i.e.,
below 15) I had
no dearer wish than to possess a friend of similar
tastes. I have
sought, hoped, waited, grieved, and been at last
disillusioned,
overcome by desire and despair, and have not found
that friend.
Even later the hope often reappeared, but always in
vain, and I
cannot boast of that sure recognition which one
reads of in the
autobiographies of Urnings. I do not know personally
a single
fellow-sufferer. It is also doubtful whether such an
acquaintanceship would greatly help me, for I have a
very
peculiar conception of homosexuality. As you will
see, I have
little more in common with what are called pæderasts
than sexual
indifference to the female sex, and I often ask
myself: 'Does any
other man in the whole world feel like you? Are you
alone in the
earth with your morbid desires? Are you a pariah of
pariahs, or
is there, perhaps, another soul with similar
longings living near
you? How often in summer have I gone to the lakes
and streams
outside cities to seek boys bathing; but I always
came back
unsatisfied, whether I found any or not. And in
winter I have
been irresistibly impelled to return to the same
spots, as if it
were sanctified by the boys, but my darlings had

vanished and

cold winds blew over the icy floods, so that I would return

feeling as though I had buried all my happiness.

"It must be borne in mind, therefore, that what I have to say

regarding my sexual impulses only refers to fancies and never to

their practical realization. My sensual impulses are not

connected with the sexual organs; all my voluptuous ideas are not

in the least connected with these parts. For this reason I have

never practiced onanism and *_immissio membri in anum_* is as

repulsive to me as to a normal man. Even every imitation of

coitus is, for me, without attraction. In a boy's body two things

specially excite me: *_his belly and his nates_*, the first as

containing the digestive tract, the second as holding the opening

of the bowels. Of the vegetable processes of life in the boy none

interest me nearly so much as the progress of his digestion and

the process of defecation. It is incredible to what an extent

this part of physiology has occupied me from youth. If as a boy I

wanted to read something of a piquantly exciting character I

sought in my father's encyclopædia for articles like:

Obstruction, Constipation, Hæmorrhoids, Fæces, etc. No function

of the body seemed to be so significant as this, and I regarded

its disturbances as the most important in the whole mechanism of

life. The description of other disorders I could read in cold

blood, but intussusception of the bowels makes me
ill even
to-day. I am always extremely pleased to hear that
the digestion
of the people around me is in good condition. A man
who did not
sufficiently watch over his digestion aroused
distrust in me, and
I imagined that wicked men must be horribly
indifferent regarding
this weighty matter. Even more than in ordinary
persons was I
interested in the digestion of more mysterious
beings, like
magicians in legends, or men of other nations. I
would willingly
have made an anthropological study of my favorite
subject, only
to my annoyance books nearly always pass over the
matter in
silence. In history and fiction I regretted the
absence of
information concerning the state of my heroes'
digestion when
they languished in prison or in some unaccustomed or
unhealthy
spot. For this reason I held no book more precious
than one which
describes how a young man after being shipwrecked
lived for a
long time in a narrow snow-hut, and it was
conscientiously stated
that he became aware of digestive disturbances. No
immorality
angers me more than the foolish practice of ladies
who in society
neglect the satisfaction of their natural needs from
misplaced
motives of modesty. On a railway journey I suffer
horribly from
the thought that one of my fellow-travelers may be
prevented from
fulfilling some imperative natural necessity.

"I naturally devote the greatest attention to my own

digestion.

With painful conscientiousness I go to stool every day at the same hour; if the operation does not come off to my satisfaction

I feel not so much physical as mental discomfort. To this quite

useful hygienic interest became associated at puberty a sensual

interest. Since my fourteenth year I have had no greater

enjoyment than to defecate undressed (I do not do so now) after

having first carefully examined the distension of my abdomen. In

summer I would go into the woods, undress myself in a secluded

spot and indulge in the voluptuous pleasures of defecation. I

would sometimes combine with this a bath in a stream. I would

exhaust my imagination in the effort to invent specially

enjoyable variations, longed for a desert island where I could go

about naked, fill my body with much nourishing food, hold in the

excrement as long as possible and then discharge it in some

subtly-thought-out spot. These practices and ideas often caused

erections and later on emissions, but the genitals played no part

in my conceptions; their movements were uncomfortable and gave no

pleasure.

"I soon longed to be associated in these orgies with some boy of

the same age, but I wanted not only a companion in my passion,

but also a real friend. Since there could be no question of

masturbation or pæderasty, our love would have been limited to

kisses, embraces, and--as a compensation for coitus-
-defecation
together. That would have been perfect bliss to me.
I will spare
you the unæsthetic contents of my voluptuous dreams.
But I
remained without a companion, and, therefore,
without real
enjoyment. [He has, however, on various occasions
experienced
erections, and even emissions, on seeing, by chance,
men or boys
defecate.] Hinc illæ lacrimæ; the excitement over my
own
defecation only took place *_faute de mieux_*.

"I knew very well that my thoughts and practices
were impure and
contemptible. Ah! how often, when the intoxication
was over, have
I thrown myself remorsefully on my knees, praying to
God for
pardon! For some weeks I repressed my longing; but
at last it was
too strong for me, I tried to justify myself and
fell into my
vice anew. That I was guilty of licentiousness and
loved boys
sexually first became clear to me later on, when I
knew the
significance of erection as a sign of sexual
excitement.

"No one can imagine with what demoniacal joy I am
possessed at
the thought of a beautiful naked boy whose abdomen
is filled as
the result of long abstinence from stool. The
thought powerfully
excites me, a flood of passion goes through my blood
and my limbs
tremble. I would never grow tired of feeling that
belly and
looking at it. My passion would express itself in
tempestuous

caresses, and the boy would have to assume various positions in order to show off the beauty of his form, i.e., to bring the parts in question into better view. To observe defecation would still further increase this peculiar enjoyment. If the boy's bowels were not sufficiently filled I would feed him with all sorts of food which produces much excrement, such as potatoes, coarse bread, etc. If possible I would seek to delay defecation for two or three days, so that it might be as copious as possible. When at last it occurred it would be an unspeakable joy for me to watch the fæces--which would have to be fairly firm--emerging from the anus."

X. would like to be a teacher and thinks he could exert a beneficial influence on boys. In spite of the pain he has suffered he does not think he would like to be cured of his perverse inclinations, for they have given him joy as well as pain, and the pain has chiefly been owing to the fact that he could not gratify his inclinations. X. smokes and drinks in moderation, and has no feminine habits. (The foregoing is a condensed summary of the case which is fully reported by Moll, Konträre Sexualempfindung, third edition, pp. 295-305.)

The case of coprolagnia communicated to me is that of a married man, normal in all other respects, intellectually brilliant and

filling successfully a very responsible position.
When a child
the women of his household were always indifferent
as to his
presence in their bedrooms, and would satisfy all
natural calls
without reserve before him. He would dream of this
with
erections. His sexual interests became slowly
centered in the act
of defecation, and this fetich throughout life never
appealed to
him so powerfully as when associated with the
particular type of
household furniture which was used for this purpose
in his own
house. The act of defecation in the opposite sex or
anything
pertaining to or suggesting the same caused
uncontrollable sexual
excitement; the nates also exerted a great
attraction. The alvine
excreta exerted this influence even in the absence
of the woman;
it was, however, necessary that she should be a
sexually
desirable person. The perversion in this case was
not complete;
that is to say, that the excitement produced by the
act of
defecation or the excretion itself was not actually
preferred to
coitus; the sexual idea was normal coitus in the
normal manner,
but preceded by the visual and olfactory enjoyment
of the
exciting fetich. When coitus was not possible the
enjoyment of
the fetich was accompanied by masturbation (as in
the analogous
case of urolagnia in a woman summarized on p. 62.)
On one
occasion he was discovered by a friend in a bedroom
belonging to
a woman, engaged in the act of masturbation over a

vessel

containing the desired fetich. In an agony of shame he begged the

mercy of silence concerning this episode, at the same time

revealing his life-history. He has constantly been haunted by the

dread of detection, as well as by remorse and the consciousness

of degradation, also by the fear that his unconquerable obsession

may lead him to the asylum.

The scatologic groups of sexual perversions, urolagnia and coprolagnia, as

may be sufficiently seen in this brief summary, are not merely olfactory

fetiches. They are, in a larger proportion of cases, dynamic symbols, a

preoccupation with physiological acts which, by associations of contiguity

and still more of resemblance, have gained the virtue of stimulating in

slight cases, and replacing in more extreme cases, the normal

preoccupation with the central physiological act itself. We have seen that

there are various considerations which amply suffice to furnish a basis

for such associations. And when we reflect that in the popular mind, and

to some extent in actual fact, the sexual act itself is, like urination

and defecation, an excretory act, we can understand that the true

excretory acts may easily become symbols of the pseudo-excretory act. It

is, indeed, in the muscular release of accumulated pressures and tensions,

involved by the act of liberating the stored-up excretion, that we have

the closest simulacrum of the tumescence and detumescence of the sexual

process.[32]

In this way the erotic symbolism of urolagnia and coprolagnia is completely analogous with that dynamic symbolism of the clinging and swinging garments which Herrick has so accurately described, with the complex symbolism of flagellation and its play of the rod against the blushing and trembling nates, with the symbols of sexual strain and stress which are embodied in the foot and the act of treading.

FOOTNOTES:

[24] Fuchs (*_Das Erotische Element In der Karikatur_*, p. 26), distinguishing sharply between the "erotic" and the "obscene," reserves the latter term exclusively for the representation of excretory organs and acts. He considers that this is etymologically the most exact usage. However that may be, it seems to me that, in any case, "obscene" has become so vague a term that it is now impracticable to give it a restricted and precise sense.

[25] In this connection we may profitably contemplate the hand and recall the vast gamut of functions, sacred and profane, which that organ exercises. Many savages strictly reserve the left hand to the lowlier purposes of life; but in civilization that is not considered necessary, and it may be wholesome for some of us to meditate on the more humble uses of the same hand which is raised in the supreme gesture of benediction and which men have often counted it a privilege to kiss.

[26] See, e.g., Morselli, *_Una Causa di Nullità del Matrimonio_*, 1902, p.

39.

[27] Féré, *_Comptes-Rendus Société de Biologie_*, July 23, 1904.

[28] Transactions of the International Medical Congress, Moscow, vol. iv, p. 19. A similar symbolism may be traced in many of the cases in which the focus of modesty becomes in modest women centered in the excretory sphere and sometimes exaggerated to the extent of obsession. It must not be supposed, however, that every obsession in this sphere has a symbolical value of an erotic kind. In the case, for instance, which has been recorded by Raymond and Janet (*_Les Obsessions_*, vol. ii, p. 306) of a woman who spent much of her time in the endeavor to urinate perfectly, always feeling that she failed in some respect, the obsession seems to have risen fortuitously on a somewhat neurotic basis without reference to the sexual life.

[29] *_Anatomy of Melancholy_*, Part III, Section II, Mem. III, Subs. I.

[30] It may be remarked here that while the eating of excrement (apart from its former use as a magic charm and as a therapeutic agent) is in civilization now confined to sexual perverts and the insane, among some animals it is normal as a measure of hygiene in relation to their young. Thus, as, e.g., the Rev. Arthur East writes, the mistle thrush swallows the droppings of its young. (*_Knowledge_*, June 1, 1899, p. 133.) In the dog I have observed that the bitch licks her puppies shortly after birth as they urinate, absorbing the fluid.

[31] See, e.g., the previous volume of these Studies, "Sexual Selection in Man," pp. 165 et seq., and Dühren, Geschlechtsleben in England, bd. ii, pp. 258, et seq.

[32] In the study of Love and Pain in a previous volume (p. 130) I have quoted the remarks of a lady who refers to the analogy between sexual tension and vesical tension--"Cette volupté que ressentent les bords de la mer, d'être toujours pleins sans jamais déborder"--and its erotic significance.

IV.

Animals as Sources of Erotic Symbolism--Mixoscopic Zoophilia--The Stuff-fetichisms--Hair-fetichism--The Stuff-fetichisms Mainly on a Tactile Base--Erotic Zoophilia--Zooerastia--Bestiality--The Conditions that Favor Bestiality--Its Wide Prevalence Among Primitive Peoples and Among Peasants--The Primitive Conception of Animals--The Goat--The Influence of Familiarity with Animals--Congress Between Women and Animals--The Social Reaction Against Bestiality.

The erotic symbols with which we have so far been concerned have in every case been portions of the body, or its physiological processes, or at least the garments which it has endowed with life. The association on which the symbol has arisen has in every case been in large measure,

although not entirely, an association of contiguity. It is now necessary to touch on a group of sexual symbols in which the association of contiguity with the human body is absent: the various methods by which animals or animal products or the sight of animal copulation may arouse sexual desire in human persons. Here we encounter a symbolism mainly founded on association by resemblance; the animal sexual act recalls the human sexual act; the animal becomes the symbol of the human being.

The group of phenomena we are here concerned with includes several subdivisions. There is first the more or less sexual pleasure sometimes experienced, especially by young persons, in the sight of copulating animals. This I would propose to call Mixoscopic Zoophilia; it falls within the range of normal variation. Then we have the cases in which the contact of animals, stroking, etc., produces sexual excitement or gratification; this is a sexual fetichism in the narrow sense, and is by Krafft-Ebing termed Zoophilia Erotica. We have, further, the class of cases in which a real or simulated sexual intercourse with animals is desired. Such cases are not regarded as fetichism by Krafft-Ebing,[33] but they come within the phenomena of erotic symbolism as here understood. This class falls into two divisions: one in which the individual is fairly normal, but belongs to a low grade of culture; the other in which he may belong to a more refined social class, but is affected by a deep degree of degeneration. In the first case we may properly apply the term bestiality;

in the second case it may perhaps be better to use the term zoerastia, proposed by Krafft-Ebing.[34]

Among children, both boys and girls, it is common to find that the copulation of animals is a mysteriously fascinating spectacle. It is inevitable that this should be so, for the spectacle is more or less clearly felt to be the revelation of a secret which has been concealed from them. It is, moreover, a secret of which they feel intimate reverberations within themselves, and even in perfectly innocent and ignorant children the sight may produce an obscure sexual excitement.[35]

It would seem that this occurs more frequently in girls than in boys. Even in adult age, it may be added, women are liable to experience the same kind of emotion in the presence of such spectacles. One lady recalls, as a girl, that on several occasions an element of physical excitement entered into the feelings with which she watched the coquetry of cats. Another lady mentions that at the age of about 25, and when still quite ignorant of sexual matters, she saw from a window some boys tickling a dog and inducing sexual excitement in the animal; she vaguely divined what they were doing, and though feeling disgust at their conduct she at the same time experienced in a strong degree what she now knows was sexual excitement. The coupling of the larger animals is often an impressive and splendid spectacle which is far, indeed, from being obscene, and has commended itself to persons of intellectual distinction;[36] but in young or ill-balanced minds such sights tend to become both

prurient and morbid.

I have already referred to the curious case of a sexually hyperæsthetic nun who was always powerfully excited by the sight or even the recollection of flies in sexual connection, so that she was compelled to masturbate; this dated from childhood. After becoming a nun she recorded having had this experience, followed by masturbation, more than four hundred times.[37] Animal spectacles sometimes produce a sexual effect on children even when not specifically sexual; thus a correspondent, a clergyman, informs me that when a young and impressionable boy, he was much affected by seeing a veterinary surgeon insert his hand and arm into a horse's rectum, and dreamed of this several times afterward with emissions.

While the contemplation of animal coitus is an easily intelligible and in early life, perhaps, an almost normal symbol of sexual emotion, there is another subdivision of this group of animal fetichisms which forms a more natural transition from the fetichisms which have their center in the human body: the stuff-fetichisms, or the sexual attraction exerted by various tissues, perhaps always of animal origin. Here we are in the presence of a somewhat complicated phenomenon. In part we have, in a considerable number of such cases, the sexual attraction of feminine garments, for all such tissues are liable to enter into the dress. In part, also, we have a sexual perversion of tactile sensibility, for in a considerable proportion of these cases it is the touch sensations which

are potent in arousing the erotic sensations. But in part, also, it would seem, we have here the conscious or subconscious presence of an animal fetich, and it is notable that perhaps all these stuffs, and especially fur, which is by far the commonest of the groups, are distinctively animal products. We may perhaps regard the fetich of feminine hair--a much more important and common fetich, indeed, than any of the stuff fetichisms--as a link of transition. Hair is at once an animal and a human product, while it may be separated from the body and possesses the qualities of a stuff. Krafft-Ebing remarks that the senses of touch, smell, and hearing, as well as sight, seem to enter into the attraction exerted by hair.

The natural fascination of hair, on which hair-fetichism is founded, begins at a very early age. "The hair is a special object of interest with infants," Stanley Hall concludes, "which begins often in the latter part of the first year.... The hair, no doubt, gives quite unique tactile sensations, both in its own roots and to hands, and is plastic and yielding to the motor sense, so that the earliest interest may be akin to that in fur, which is a marked object in infant experience. Some children develop an almost fetichistic propensity to pull or later to stroke the hair or beard of every one with whom they come in contact." (G. Stanley Hall, "The Early Sense of Self," American Journal of Psychology, April, 1898, p. 359.)

It should be added that the fascination of hair for the infantile and childish mind is not necessarily one of attraction, but may be of repulsion. It happens here, as in the case of so many characteristics which are of sexual significance, that we are in the presence of an object which may exert a dynamic emotional force, a force which is capable of repelling with the same energy that it attracts. Féré records the instructive case of a child of 3, of psychopathic heredity, who when he could not sleep was sometimes taken by his mother into her bed. One night his hand came in contact with a hairy portion of his mother's body, and this, arousing the idea of an animal, caused him to leap out of the bed in terror. He became curious as to the cause of his terror and in time was able to observe "the animal," but the train of feelings which had been set up led to a life-long indifference to women and a tendency to homosexuality. It is noteworthy that he was attracted to men in whom the hair and other secondary sexual characters were well developed. (Féré, L'Instinct Sexuel, second edition, pp. 262-267.)

As a sexual fetich hair strictly belongs to the group of parts of the body; but since it can be removed from the body and is sexually effective as a fetich in the absence of the person to whom it belongs, it is on a level with the garments which may serve in a similar way, with shoes or handkerchiefs

or gloves.

Psychologically, hair-fetichism presents no special problem, but the wide attraction of hair--it is sexually the most generally noted part of the feminine body after the eyes--and the peculiar facility with which when plaited it may be removed, render hair-fetichism a sexual perversion of specially great medico-legal interest.

The frequency of hair-fetichism, as well as of the natural admiration on which it rests, is indicated by a case recorded by Laurent. "A few years ago," he states, "one constantly saw at the Bal Bullier, in Paris, a tall girl whose face was lean and bony, but whose black hair was of truly remarkable length. She wore it flowing down her shoulders and loins. Men often followed her in the street to touch or kiss the hair. Others would accompany her home and pay her for the mere pleasure of touching and kissing the long black tresses. One, in consideration of a relatively considerable sum, desired to pollute the silky hair. She was obliged to be always on her guard, and to take all sorts of precautions to prevent any one cutting off this ornament, which constituted her only beauty as well as her livelihood." (E. Laurent, *L'Amour Morbide*, 1891, p. 164; also the same author's *Fétichistes et Erotomanes*, p. 23.)

The hair despoiler (*Coupeur des Nattes* or *Zopfabschneider*)

may be found in any civilized country, though the most carefully studied cases have occurred in Paris. (Several medico-legal histories of hair-despoilers are summarized by Krafft-Ebing, Op. cit., pp. 329-334). Such persons are usually of nervous temperament and bad heredity; the attraction to hair occasionally develops in early life; sometimes the morbid impulse only appears in later life after fever. The fetich may be either flowing hair or braided hair, but is usually one or the other, and not both. Sexual excitement and ejaculation may be produced in the act of touching or cutting off the hair, which is subsequently, in many cases, used for masturbation. As a rule the hair-despoiler is a pure fetichist, no element of sadistic pleasure entering into his feelings. In the case of a "capillary kleptomaniac" in Chicago--a highly intelligent and athletic married young man of good family--the impulse to cut off girls' braids appeared after recovery from a severe fever. He would gaze admiringly at the long tresses and then clip them off with great rapidity; he did this in some fifty cases before he was caught and imprisoned. He usually threw the braids away before he reached home. (Alienist and Neurologist, April, 1889, p. 325.) In this case there is no history of sexual excitement, probably because no proper medico-legal examination was made. (It may be added that hair-despoilers have been specially studied by

Motet, "Les
Coupeurs de Nattes," *_Annales d'Hygiène_,* 1890.)

The stuff-fetiches are most usually fur and velvet; feathers, silk, and leathers also sometimes exert this influence; they are all, it will be noted, animal substances.[38] The most interesting is probably fur, the attraction of which is not uncommon in association with passive algolagnia. As Stanley Hall has shown, the fear of fur, as well as the love of it, is by no means uncommon in childhood; it may appear even in infancy and in children who have never come in contact with animals.[39] It is noteworthy that in most cases of uncomplicated stuff-fetichism the attraction apparently arises on a congenital basis, as it appears in persons of nervous or sensitive temperament at an early age and without being attached to any definite causative incident. The sexual excitation is nearly always produced by the touch rather than by the sight. As we found, when dealing with the sense of touch in the previous volume, the specific sexual sensations may be regarded as a special modification of ticklishness. The erotic symbolism in the case of these stuff-fetichisms would seem to be a more or less congenital perversion of ticklishness in relation to specific animal contacts.

A further degree of perversion in this direction is reached in a case of erotic *_zoophilia_*, recorded by Krafft-Ebing.[40] In this case a congenital neuropath, of good intelligence but delicate and anæmic, with feeble sexual powers, had a great love of domestic animals, especially

dogs and cats, from an early age; when petting them he experienced sexual emotions, although he was innocent in sexual matters. At puberty he realized the nature of his feelings and tried to break himself of his habits. He succeeded, but then began erotic dreams accompanied by images of animals, and these led to masturbation associated with ideas of a similar kind. At the same time he had no wish for any sort of sexual intercourse with animals, and was indifferent as to the sex of the animals which attracted him; his sexual ideals were normal. Such a case seems to be fundamentally one of fetichism on a tactile basis, and thus forms a transition between the stuff-fetichisms and the complete perversions of sexual attraction toward animals.

In some cases sexually hyperæsthetic women have informed me that sexual feeling has been produced by casual contact with pet dogs and cats. In such cases there is usually no real perversion, but it seems probable that we may here have an occasional foundation for the somewhat morbid but scarcely vicious excesses of affection which women are apt to display towards their pet dogs or cats. In most cases of this affection there is certainly no sexual element; in the case of childless women, it may rather be regarded as a maternal than as an erotic symbolism. (The excesses of this non-erotic zoophilia have been discussed by Féré,
L'Instinct Sexuel, second edition, pp. 166-171.)

Krafft-Ebing considers that complete perversion of

sexual attraction toward animals is radically distinct from erotic zoophilia. This view cannot be accepted. Bestiality and zoerastia merely present in a more marked and profoundly perverted form a further degree of the same phenomenon which we meet with in erotic zoophilia; the difference is that they occur either in more insensitive or in more markedly degenerate persons.

A fairly typical case of zoerastia has been recorded in America by Howard, of Baltimore. This was the case of a boy of 16, precociously mature and fairly bright. He was, however, indifferent to the opposite sex, though he had ample opportunity for gratifying normal passions. His parents lived in the city, but the youth had an inordinate desire for the country and was therefore sent to school in a village. On the second day after his arrival at school a farmer missed a sow which was found secreted in an outhouse on the school grounds. This was the first of many similar incidents in which a sow always took part. So strong was his passion that on one occasion force had to be used to take him away from the sow he was caressing. He did not masturbate, and even when restrained from approaching sows he had no sexual inclination for other animals. His nocturnal pollutions, which were frequent, were always accompanied by images of wallowing swine. Notwithstanding careful treatment no cure was effected; mental and physical vigor failed, and he died at the age of 23.[41]

It is, however, somewhat doubtful whether we can always or even usually distinguish between zoerastia and bestiality. Dr. G.F. Lydston, of Chicago, has communicated to me a case (in which he was consulted) which seems fairly typical and is instructive in this respect. The subject was a young man of 21, a farmer's son, not very bright intellectually, but very healthy and strong, of great assistance on the farm, very capable and industrious, such a good farm hand that his father was unwilling to send him away and to lose his services. There was no history of insanity or neurosis in the family, and no injury or illness in his own history. He had spells of moroseness and irritability, however, and had also been a masturbator. Women had no attraction for him, but he would copulate with the mares upon his father's farm, and this without regard to time, place, or spectators. Such a case would seem to stand midway between ordinary bestiality and pathological zoerastia as defined by Krafft-Ebing, yet it seems probable that in most cases of ordinary bestiality some slight traces of mental anomaly might be found, if such cases always were, as they should be, properly investigated.[42]

We have here reached the grossest and most frequent perversion in this group; bestiality, or the impulse to attain sexual gratification by intercourse, or other close contact, with animals. In seeking to comprehend this perversion it is necessary to divest ourselves of the attitude toward animals which is the inevitable outcome of refined civilization and urban life. Most sexual perversions, if

not in large
measure the actual outcome of civilized life, easily
adjust themselves to
it. Bestiality (except in one form to be noted later)
is, on the other
hand, the sexual perversion of dull, insensitive and
unfastidious persons.
It flourishes among primitive peoples and among
peasants. It is the vice
of the clodhopper, unattractive to women or inapt to
court them.

Three conditions have favored the extreme prevalence of
bestiality: (1)
primitive conceptions of life which built up no great
barrier between man
and the other animals; (2) the extreme familiarity which
necessarily
exists between the peasant and his beasts, often
combined with separation
from women; (3) various folk-lore beliefs such as the
efficacy of
intercourse with animals as a cure for venereal disease,
etc.[43]

The beliefs and customs of primitive peoples, as well as
their mythology
and legends, bring before us a community of man and
animals altogether
unlike anything we know in civilization. Men may become
animals and
animals may become men; animals and men may communicate
with each other
and live on terms of equality; animals may be the
ancestors of human
tribes; the sacred totems of savages are most usually
animals. There is no
shame or degradation in the notion of a sexual
relationship between men
and animals, because in primitive conceptions animals
are not inferior
beings separated from man by a great gulf. They are much
more like men in
disguise, and in some respects possess powers which make
them superior to

men. This is recognized in those plays, festivals, and religious dances, so common among primitive peoples, in which animal disguises are worn.[44] When men admire and emulate the qualities of animals and are proud to believe that they descend from them, it is not surprising that they should sometimes see nothing derogatory in sexual intercourse with them.[45]

A significant relic of primitive conceptions in this matter may perhaps be found in the religious rites connected with the sacred goat of Mendes described by Herodotus. After telling how the Mendesiensians reverence the goat, especially the he-goat, out of their veneration for Pan, whom they represent as a goat ("the real motive which they assign for this custom I do not choose to relate"), he adds: "It happened in this country, and within my remembrance, and was indeed universally notorious, that a goat had indecent and public communication with a woman." [46] The meaning of the passage evidently is that in the ordinary intercourse of women with the sacred goat, connection was only simulated or incomplete on account of the natural indifference of the goat to the human female, but that in rare cases the goat proved sexually excitable with the woman and capable of connection.[47] The goat has always been a kind of sacred emblem of lust. In the middle ages it became associated with the Devil as one of the favorite forms he assumed. It is significant of a primitively religious sexual association between men and animals, that witches constantly confessed, or were made to confess, that they had had intercourse with the

Devil in the shape of an animal, very frequently a dog. The figures of human beings and animals in conjunction carved on temples in India, also seem to indicate the religious significance which this phenomenon sometimes presents. There is, indeed, no need to go beyond Europe even in her moments of highest culture to find a religious sanction for sexual union between human beings, or gods in human shape, and animals. The legends of Io and the bull, of Leda and the swan, are among the most familiar in Greek mythology, and in a later pictorial form they constitute some of the most cherished works of the painters of the Renaissance.

As regards the prevalence of occasional sexual intercourse between men or women and animals among primitive peoples at the present time, it is possible to find many scattered references by travelers in all parts of the world. Such references by no means indicate that such practices are, as a rule, common, but they usually show that they are accepted with a good-humored indifference.[48]

Bestiality is very rarely found in towns. In the country this vice of the clodhopper is far from infrequent. For the peasant, whose sensibilities are uncultivated and who makes but the most elementary demands from a woman, the difference between an animal and a human being in this respect scarcely seems to be very great. "My wife was away too long," a German peasant explained to the magistrate, "and so I went with my sow." It is certainly an explanation that to the uncultivated peasant, ignorant of

theological and juridical conceptions, must often seem natural and sufficient.

Bestiality thus resembles masturbation and other abnormal manifestations of the sexual impulse which may be practiced merely _faute de mieux_ and not as, in the strict sense, perversions of the impulse. Even necrophily may be thus practiced. A young man who when assisting the gravedigger conceived and carried out the idea of digging up the bodies of young girls to satisfy his passions with, and whose case has been recorded by Belletrud and Mercier, said: "I could find no young girl who would agree to yield to my desires; that is why I have done this. I should have preferred to have relations with living persons. I found it quite natural to do what I did: I saw no harm in it, and I did not think that any one else could. As living women felt nothing but repulsion for me, it was quite natural I should turn to the dead, who have never repulsed me. I used to say tender things to them like 'my beautiful, my love, I love you.'" (Belletrud and Mercier "Perversion de l'Instinct Génésique," _Annales d'Hygiène Publique_, June, 1903.) But when so highly abnormal an act is felt as natural we are dealing with a person who is congenitally defective so far as the finer developments of intelligence are concerned. It was so in this case of necrophily; he was the son of a weak-minded

woman of

unrestrainable sexual inclinations, and was himself somewhat

feeble-minded; he was also, it is instructive to observe, anosmic.

But it is by no means only their dulled sensibility or the absence of

women, which accounts for the frequency of bestiality among peasants. A

highly important factor is their constant familiarity with animals. The

peasant lives with animals, tends them, learns to know all their

individual characters; he understands them far better than he understands

men and women; they are his constant companions, his friends. He knows,

moreover, the details of their sexual lives, he witnesses the often highly

impressive spectacle of their coupling. It is scarcely surprising that

peasants should sometimes regard animals as being not only as near to them

as their fellow human beings, but even nearer.

The significance of the factor of familiarity is indicated by the great

frequency of bestiality among shepherds, goatherds, and others whose

occupation is exclusively the care of animals. Mirabeau, in the eighteenth

century, stated, on the evidence of Basque priests, that all the shepherds

in the Pyrenees practice bestiality. It is apparently much the same in

Italy.[49] In South Italy and Sicily, especially, bestiality among

goatherds and peasants is said to be almost a national custom.[50] In the

extreme north of Europe, it is reported, the reindeer, in this respect,

takes the place of the goat.

The importance of the same factor is also shown by the fact that when among women in civilization animal perversions appear, the animal is nearly always a pet dog. Usually in these cases the animal is taught to give gratification by cunnilingus. In some cases, however, there is really sexual intercourse between the animal and the woman.

Moll mentions that in a case of cunnilingus by a dog in Germany there was a difficulty as to whether the matter should be considered an unnatural offence or simply an offence against decency; the lower court considered it in the former light, while the higher court took the more merciful view. (Moll, Untersuchungen über die Libido Sexualis, bd. i, p. 697.) In a case reported by Pfaff and mentioned by Moll, a country girl was accused of having sexual intercourse with a large dog. On examination Pfaff found in the girl's thick pubic hair a loose hair which under the microscope proved to belong to the dog. (Loc. cit., p. 698.) In such a case it must be noted that while this evidence may be held to show sexual contact with the dog, it scarcely suffices to show sexual intercourse. This has, however, undoubtedly occurred from time to time, even more or less openly. Bloch (Op. cit., pp. 277 and 282) remarks that this is not an infrequent exhibition given by prostitutes in certain brothels. Maschka has referred to such an exhibition between a woman and a bull-dog, which was given to select circles in

Paris. Rosse

refers to a case in which a young unmarried woman in Washington

was surprised during intercourse with a large English mastiff,

who in his efforts to get loose caused such severe injuries that

the woman died from hæmorrhage in about an hour.

Rosse also

mentions that some years ago a performance of this kind between a

prostitute and a Newfoundland dog could be witnessed in San

Francisco by paying a small sum; the woman declared that a woman

who had once copulated with a dog would ever afterwards prefer

this animal to a man. Rosse adds that he was acquainted with a

similar performance between a woman and a donkey, which used to

take place in Europe (Irving Rosse, "Sexual Hypochondriasis and

Perversion of the Genesic Instinct," *Virginia Medical Monthly*,

October, 1892, p. 379). Juvenal mentions such relations between

the donkey and woman (vi, 332). Krauss (quoted by Bloch,

Beiträge zur Ätiologie der Psychopathia Sexualis, Teil II, p.

276) states that in Bosnia women sometimes carry on these

practices with dogs and also--as he would not have believed had

he not on one occasion observed it--with cats. "It seems to me,"

writes Dr. Kiernan, of Chicago, (private letter) "that what Rosse

says of the animal exhibitions in San Francisco is true of all

great cities. The animal employed in such exhibitions here has

usually been a donkey, and in one instance death occurred from

the animal trampling the girl partner. The practice described occurs in country regions quite frequently. Thus in a case reported in the suburbs of Omaha, Nebraska, a sixteen-year-old boy engaged in rectal coitus with a large dog. In attempting to extricate his swollen penis from the boy's rectum the dog tore through the _sphincter ani_ an inch into the gluteus muscles. (_Omaha Clinic_, March, 1893.) In a Missouri case, which I verified, a smart, pretty, well-educated country girl was found with a profuse offensive vaginal discharge which had been present for about a week, coming on suddenly. After washing the external genitals and opening the labia three rents were discovered, one through the fourchette and two through the left nymphæ. The vagina was excessively congested and covered with points bleeding on the slightest irritation. The patient confessed that one day while playing with the genitals of a large dog she became excited and thought she would have slight coitus. After the dog had made an entrance she was unable to free herself from him, as he clasped her so firmly with his fore legs. The penis became so swollen that the dog could not free himself, although for more than an hour she made persistent efforts to do so. (_Medical Standard_, June, 1903, p. 184). In an Indiana case, concerning which I was consulted, the girl was a hebephreniac who had resorted to this procedure with a Newfoundland dog

at the

instance of another girl, seemingly normal as regards mentality, and had been badly injured; a discharge resulted which resembled gonorrhoea, but contained no gonococci. These cases are probably more frequent than is usually assumed."

Women are known to have had intercourse with various other

animals, occasionally or habitually, in various parts of the

world. Monkeys have been mentioned in this connection. Moll

remarks that it seems to be an indication of an abnormal interest

in monkeys that some women are observed by the attendants in the

monkey-house of zoölogical gardens to be very frequent visitors.

Near the Amazon the traveler Castelnau saw an enormous Coati

monkey belonging to an Indian woman and tried to purchase it;

though he offered a large sum, the woman only laughed. "Your

efforts are useless," remarked an Indian in the same cabin, "he

is her husband." (So far as the early literature of this subject

is concerned, a number of facts and fables regarding the congress

of women with dogs, goats and other animals was brought together

at the beginning of the eighteenth century by Schurig in his

Gynæcologia, Section II, cap. VII; I have not drawn on this collection.)

In some cases women, and also men, find gratification in the

sexual manipulation of animals without any kind of congress. This

may be illustrated by an observation communicated to me by a

correspondent, a clergyman. "In Ireland, my father's house

adjoined the residence of an archdeacon of the established

church. I was then about 20 and was still kept in religious awe

of evil ways. The archdeacon had two daughters, both of whom he

brought up in great strictness, resolved that they should grow up

examples of virtue and piety. Our stables adjoined, and were

separated only by a thin wall in which was a doorway closed up by

some boards, as the two stables had formerly been one. One night

I had occasion to go to our stable to search for a garden tool I

had missed, and I heard a door open on the other side, and saw a

light glimmer through the cracks of the boards. I looked through

to ascertain who could be there at that late hour, and soon

recognized the stately figure of one of the daughters, F.F. was

tall, dark and handsome, but had never made any advances to me,

nor had I to her. She was making love to her father's mare after

a singular fashion. Stripping her right arm, she formed her

fingers into a cone, and pressed on the mare's vulva. I was

astonished to see the beast stretching her hind legs as if to

accommodate the hand of her mistress, which she pushed in

gradually and with seeming ease to the elbow. At the same time

she seemed to experience the most voluptuous sensation, crisis

after crisis arriving." My correspondent adds that,

being

exceedingly curious in the matter, he tried a somewhat similar experiment himself with one of his father's mares and experienced what he describes as "a most powerful sexual battery" which produced very exciting and exhausting effects. Näcke (*Psychiatrische en Neurologische Bladen*, 1899, No. 2) refers to an idiot who thus manipulated the vulva of mares in his charge.

The case has been recorded by Guillereau (*Journal de Médecine Vétérinaire et de Zootechnie*, January, 1899) of a youth who was accustomed to introduce his hand into the vulva of cows in order to obtain sexual excitement.

The possibility of sexual excitement between women and animals involves a certain degree of sexual excitability in animals from contact with women. Darwin stated that there could be no doubt

that various quadrumanous animals could distinguish women from men--in the first place probably by smell and secondarily by sight--and be thus liable to sexual excitement. He quotes the

opinions on this point of Youatt, Brehm, Sir Andrew Smith and

Cuvier (*Descent of Man*, second edition, p. 8).

Moll quotes the

opinion of an experienced observer to the same effect

(*Untersuchungen über die Libido Sexualis*, Bd. i, p. 429).

Hufeland reported the case of a little girl of three who was

playing, seated on a stool, with a dog placed between her thighs and locked against her. Seemingly excited by this

contact the
animal attempted a sort of copulation, causing the
genital parts
of the child to become inflamed. Bloch (Op. cit.,
p. 280, et
seq.) discusses the same point; he does not
consider that
animals will of their own motion sexually cohabit
with women, but
that they may be easily trained to it. There can be
no doubt that
dogs at all events are sometimes sexually excited by
the presence
of women, perhaps especially during menstruation,
and many women
are able to bear testimony to the embarrassing
attentions they
have sometimes received from strange dogs. There can
be no
difficulty in believing that, so far as
cunnilinctus is
concerned dogs would require no training. In a case
recorded by
Moll (Konträre Sexualempfindung, third edition, p.
560) a lady
states that this was done to her when a child, as
also to other
children, by dogs who, she said, showed signs of
sexual
excitement. In this case there was also sexual
excitement thus
produced in the child, and after puberty mutual
cunnilinctus
was practiced with girl friends. Guttzeit (Dreissig
Jahre
Praxis, Theil I, p. 310) remarks that some Russian
officers who
were in the Turkish campaign of 1828 told him that
from fear of
venereal infection in Wallachia they refrained from
women and
often used female asses which appeared to show signs
of sexual
pleasure.

A very large number of animals have been recorded as having been employed in the gratification of sexual desire at some period or in some country, by men and sometimes by women. Domestic animals are naturally those which most frequently come into question, and there are few if any of these which can altogether be excepted. The sow is one of the animals most frequently abused in this manner.[51] Cases in which mares, cows, and donkeys figure constantly occur, as well as goats and sheep. Dogs, cats, and rabbits are heard of from time to time. Hens, ducks, and, especially in China, geese, are not uncommonly employed. The Roman ladies were said to have had an abnormal affection for snakes. The bear and even the crocodile are also mentioned.[52]

The social and legal attitude toward bestiality has reflected in part the frequency with which it has been practiced, and in part the disgust mixed with mystical and sacrilegious horror which it has aroused. It has sometimes been met merely by a fine, and sometimes the offender and his innocent partner have been burnt together. In the middle ages and later its frequency is attested by the fact that it formed a favorite topic with preachers of the fifteenth and sixteenth centuries. It is significant that in the Penitentials,--which were criminal codes, half secular and half spiritual, in use before the thirteenth century, when penance was relegated to the judgment of the confessor,--it was thought necessary to fix the periods of penance which should be undergone respectively by bishops, priests and deacons who should be guilty of

bestiality.

In Egbert's Penitential, a document of the ninth and tenth centuries, we read (V. 22): "Item Episcopus cum quadrupede fornicans VII annos, consuetudinem X, presbyter V, diaconus III, clerus II." There was a great range in the penances for bestiality, from ten years to (in the case of boys) one hundred days. The mare is specially mentioned (Haddon and Stubbs, Councils and Ecclesiastical Documents, vol. iii, p. 422). In Theodore's Penitential, another Anglo-Saxon document of about the same age, those who habitually fornicate with animals are adjudged ten years of penance. It would appear from the Penitentiale Pseudo-Romanum (which is earlier than the eleventh century) that one year's penance was adequate for fornication with a mare when committed by a layman (exactly the same as for simple fornication with a widow or virgin), and this was mercifully reduced to half a year if he had no wife. (Wasserschleben, Die Bussordnungen der Abendländlichen Kirche, p. 366). The Penitentiale Hubertense (emanating from the monastery of St. Hubert in the Ardennes) fixes ten years' penance for sodomy, while Fulbert's Penitential (about the eleventh century) fixes seven years for either sodomy or bestiality. Burchard's Penitential, which is always detailed and precise, specially mentions the mare, the cow and the ass, and assigns

forty days bread and water and seven years penance, raised to ten years in the case of married men. A woman having intercourse with a horse is assigned seven years penance in Burchard's Penitential. (Wasserschleben, *ib.* pp. 651, 659.)

The extreme severity which was frequently exercised toward those guilty of this offense, was doubtless in large measure due to the fact that bestiality was regarded as a kind of sodomy, an offense which was frequently viewed with a mystical horror apart altogether from any actual social or personal injury it caused. The Jews seem to have felt this horror; it was ordered that the sinner and his victim should both be put to death (Exodus, Ch. 22, v. 19; Leviticus, Ch. 20, v. 15). In the middle ages, especially in France, the same rule often prevailed. Men and sows, men and cows, men and donkeys were burnt together. At Toulouse a woman was burnt for having intercourse with a dog. Even in the seventeenth century a learned French lawyer, Claude Lebrun de la Rochette, justified such sentences.[53] It seems probable that even to-day, in the social and legal attitude toward bestiality, sufficient regard is not paid to the fact that this offense is usually committed either by persons who are morbidly abnormal or who are of so low a degree of intelligence that they border on feeble-mindedness. To what extent, and on what grounds, it ought to be punished is a question calling for serious reconsideration.

FOOTNOTES:

[33] For Krafft-Ebing's discussion of the subject see
Op. cit., pp.
530-539.

[34] In England it is not uncommon to use the term
"unnatural offence;"
this is an awkward and possibly misleading practice
which should not be
followed. In Germany a similar confusion is caused by
applying the term
"sodomy" to these cases as well as to pederasty. Krafft-
Ebing considers
that this error is due to the jurists, while the
theologians have always
distinguished correctly. In this matter, he adds,
science must be _ancilla
theologiae_ and return to the correct usage of words.

[35] This childish interest, with later abnormal
developments, may be seen
in History I of the Appendix to this volume.

[36] The Countess of Pembroke, Sir Philip Sidney's
sister, appears to have
found sexual enjoyment in the contemplation of the
sexual prowess of
stallions. Aubrey writes that she "was very salacious
and she had a
contrivance that in the spring of the year ... the
stallions ... were to
be brought before such a part of the house where she had
a vidette to look
on them." (_Short Lives_, 1898, vol. i, p. 311.)
Although the modern
editor's modesty has caused the disappearance of several
lines from this
passage, the general sense is clear. In the same century
Burchard, the
faithful secretary of Pope Alexander VI, describes in
his invaluable diary
how four race horses were brought to two mares in a
court of the Vatican,
the horses clamorously fighting for the possession of
the mares and

eventually mounting them, while the Pope and his daughter Lucrezia looked on from a window "cum magno risu et delectatione." (*_Diarium_*, ed Thuasne, vol. III, p. 169.)

[37] *_Archivio di Psichiatria_*, 1902, fasc. ii-iii, p. 338. In the case of pathological sexuality in a boy of 15, reported by A. MacDonald, and already summarized, the sight of copulating flies is also mentioned among many other causes of sexual excitation.

[38] Krafft-Ebing presents or quotes typical cases of all these fetiches, *_Op. cit._*, pp. 255-266.

[39] G. Stanley Hall, "A study of Fears," *_American Journal of Psychology_*, 1897, pp. 213-215.

[40] *_Op. cit._*, p. 268.

[41] W. Howard, "Sexual Perversion," *_Alienist and Neurologist_*, January, 1896. Krafft-Ebing (*op. cit.*, p. 532) quotes from Boeteau the somewhat similar case of a gardener's boy of 16--an illegitimate child of neuropathic heredity and markedly degenerate--who had a passion, of irresistible and impulsive character, for rabbits. He was declared irresponsible. Moll (*_Untersuchungen über die Libido Sexualis_*, bd. i, pp. 431-433) presents the case of a neurotic man who from the age of 15 had been sexually excited by the sight of animals or by contact with them. He had repeatedly had connection with cows and mares; he was also sexually excited by sheep, donkeys, and dogs, whether female or male; the normal sexual instinct was weak and he experienced very slight

attraction to
women.

[42] Moll also remarks ("Perverse Sexualempfindung," in Senator's and Kaminer's Krankheiten und Ehe) that in this matter it is often hardly possible to draw a sharp line between vice and disease.

[43] Instances of this widespread belief--found among the Tamils of Ceylon as well as in Europe--are quoted from various authors by Bloch, Beiträge zur Ätiologie der Psychopathia Sexualis, Teil II, p. 278, and Moll, Untersuchungen über die Libido Sexualis, bd. i, p. 700. On the frequency of bestiality, from one cause or another, in the East, see, e.g., Stern, Medizin und Geschlechtsleben in der Türkei, bd. ii, p. 219.

[44] Sometimes (as among the Aleuts) the animal pantomime dances of savages may represent the transformation of a captive bird into a lovely woman who falls exhausted into the arms of the hunter. (H.H. Bancroft, Native Races of the Pacific, vol. i, p. 93.) A system of beliefs which accepts the possibility that a human being may be latent in an animal obviously favors the practice of bestiality.

[45] For an example of the primitive confusion between the intercourse of women with animals and with men see, e.g., Boas, "Sagen aus British-Columbia," Zeitschrift für Ethnologie, heft V, p. 558.

[46] Herodotus, Book II, Chapter 46.

[47] Dulare (Des Divinités Génératrices, Chapter II) brings together the

evidence showing that in Egypt women had connection with the sacred goat, apparently in order to secure fertility.

[48] Various facts and references bearing on this subject are brought together by Blumenbach, *Anthropological Memoirs*, translated by Bendyshe, p. 80; Block, *Beiträge zur Ätiologie der Psychopathia Sexualis*, Teil II, pp. 276-283; also Ploss and Bartels, *Das Weib*, seventh edition, p. 520.

[49] Mantegazza mentions (*Gli Amori degli Uomini*, cap V) that at Rimini a young goatherd of the Apennines, troubled with dyspepsia and nervous symptoms, told him this was due to excesses with the goats in his care. A finely executed marble group of a satyr having connection with a goat, found at Herculaneum and now in the Naples Museum (reproduced in Fuchs's *Erotische Element in der Karikatur*), perhaps symbolizes a traditional and primitive practice of the goatherd.

[50] Bayle (*Dictionary*, Art, Bathyllus) quotes various authorities concerning the Italian auxiliaries in the south of France in the sixteenth century and their custom of bringing and using goats for this purpose. Warton in the eighteenth century was informed that in Sicily priests in confession habitually inquired of herdsmen if they had anything to do with their sows. In Normandy priests are advised to ask similar questions.

[51] It is worth noting that in Greek the word choiros means both a sow and a woman's pudenda; in the *Acharnians* Aristophanes plays on this association at some length. The Romans also (as may be

gathered from
Varro's *_De Re Rustica_*) called the feminine pudenda
porcus.

[52] Schurig, *_Gynæcologia_*, pp. 280-387; Bloch, *op. cit.*, 270-277. The
Arabs, according to Kocher, chiefly practice bestiality
with goats, sheep
and mares. The Annamites, according to Mondière,
commonly employ sows and
(more especially the young women) dogs. Among the Tamils
of Ceylon
bestiality with goats and cows is said to be very
prevalent.

[53] Mantegazza (*_Gli Amori degli Uomini_*, cap. V)
brings together some
facts bearing on this matter.

V.

Exhibitionism--Illustrative Cases--A Symbolic Perversion
of Courtship--The
Impulse to Defile--The Exhibitionist's Psychic Attitude--
The Sexual Organs
as Fetichs--Phallus Worship--Adolescent Pride in Sexual
Development--Exhibitionism of the Nates--The
Classification of the Forms
of Exhibitionism--Nature of the Relationship of
Exhibitionism to Epilepsy.

There is a remarkable form of erotic symbolism--very
definite and standing
clearly apart from all other forms--in which sexual
gratification is
experienced in the simple act of exhibiting the sexual
organ to persons of
the opposite sex, usually by preference to young and
presumably innocent
persons, very often children. This is termed
exhibitionism.[54] It would

appear to be a not very infrequent phenomenon, and most women, once or more in their lives, especially when young, have encountered a man who has thus deliberately exposed himself before them.

The exhibitionist, though often a young and apparently vigorous man, is always satisfied with the mere act of self-exhibition and the emotional reaction which that act produces; he makes no demands on the woman to whom he exposes himself; he seldom speaks, he makes no effort to approach her; as a rule, he fails even to display the signs of sexual excitation. His desires are completely gratified by the act of exhibition and by the emotional reaction it arouses in the woman. He departs satisfied and relieved.

A case recorded by Schrenck-Notzing very well represents both the nature of the impulse felt by the exhibitionist and the way in which it may originate. It is the case of a business man of 49, of neurotic heredity, an affectionate husband and father of a family, who, to his own grief and shame, is compelled from time to time to exhibit his sexual organs to women in the street. As a boy of 10 a girl of 12 tried to induce him to coitus; both had their sexual parts exposed. From that time sexual contacts, as of his own naked nates against those of a girl, became attractive, as well as games in which the boys and girls in turn marched before each other with their sexual parts exposed, and also imitation of the copulation of animals. Coitus was

first

practiced about the age of 20, but sight and touch of the woman's sexual parts were always necessary to produce sexual excitement.

It was also necessary--and this consideration is highly important

as regards the development of the tendency to exhibition--that

the woman should be excited by the sight of his organs. Even when

he saw or touched a woman's parts orgasm often occurred. It was

the naked sexual organs in an otherwise clothed body which

chiefly excited him. He was not possessed of a high degree of

potency. Girls between the ages of 10 and 17 chiefly excited him,

and especially if he felt that they were quite ignorant of sexual

matters. His self-exhibition was a sort of psychic defloration,

and it was accompanied by the idea that other people felt as he

did about the sexual effects of the naked organs, that he was

shocking but at the same time sexually exciting a young girl. He

was thus gratifying himself through the belief that he was

causing sexual gratification to an innocent girl.

This man was

convicted several times, and was finally declared to be suffering

from impulsive insanity. (Schrenck-Notzing, Kriminal-psychologische und Psycho-pathologische Studien, 1902,

pp. 50-57.) In another case of Schrenck-Notzing's, an actor and

portrait painter, aged 31, in youth masturbated and was fond of

contemplating the images of the sexual organs of both sexes,

finding little pleasure in coitus. At the age of 24,

at a bathing establishment, he happened to occupy a compartment next to that occupied by a lady, and when naked he became aware that his neighbor was watching him through a chink in the partition. This caused him powerful excitement and he was obliged to masturbate.

Ever since he has had an impulse to exhibit his organs and to masturbate in the presence of women. He believes that the sight of his organs excites the woman (Ib., pp. 57-68). The presence of masturbation in this case renders it untypical as a case of exhibitionism. Moll at one time went so far as to assert that when masturbation takes place we are not entitled to admit exhibitionism, (Untersuchungen über die Libido Sexualis, bd. i, p. 661), but now accepts exhibitionism with masturbation ("Perverse Sexualempfindung," Krankheiten und Ehe). The act of exhibition itself gratifies the sexual impulse, and usually it suffices to replace both tumescence and detumescence.

A fairly typical case, recorded by Krafft-Ebing, is that of a German factory worker of 37, a good, sober and intelligent workman. His parents were healthy, but one of his mother's and also one of his father's sisters were insane; some of his relatives are eccentric in religion. He has a languishing expression and a smile of self-complacency. He never had any severe illness, but has always been eccentric and

imaginative,
much absorbed in romances (such as Dumas's novels)
and fond of
identifying himself with their heroes. No signs of
epilepsy. In
youth moderate masturbation, later moderate coitus.
He lives a
retired life, but is fond of elegant dress and of
ornament.
Though not a drinker, he sometimes makes himself a
kind of punch
which has a sexually exciting effect on him. The
impulse to
exhibitionism has only developed in recent years.
When the
impulse is upon him he becomes hot, his heart beats
violently,
the blood rushes to his head, and he is oblivious of
everything
around him that is not connected with his own act.
Afterwards he
regards himself as a fool and makes vain resolutions
never to
repeat the act. In exhibition the penis is only half
erect and
ejaculation never occurs. (He is only capable of
coitus with a
woman who shows great attraction to him.) He is
satisfied with
self-exhibition, and believes that he thus gives
pleasure to the
woman, since he himself receives pleasure in
contemplating a
woman's sexual parts. His erotic dreams are of self-
exhibition to
young and voluptuous women. He had been previously
punished for
an offense of this kind; medico-legal opinion now
recognized the
incriminated man's psychopathic condition. (Krafft-
Ebing, Op.
cit., pp. 492-494.)

Trochon has reported the case of a married man of
33, a worker in

a factory, who for several years had exhibited himself at intervals to shop-girls, etc., in a state of erection, but without speaking or making other advances. He was a hard-working, honest, sober man of quiet habits, a good father to his family and happy at home. He showed not the slightest sign of insanity.

But he was taciturn, melancholic and nervous; a sister was an idiot. He was arrested, but on the report of the experts that he committed these acts from a morbid impulse he could not control he was released. (Trochon, Archives de l'Anthropologie Criminelle, 1888, p. 256.)

In a case of Freyer's (Zeitschrift für Medizinalbeamte, third year, No. 8) the occasional connection of exhibitionism with epilepsy is well illustrated by a barber's assistant, aged 35, whose father suffered from chronic alcoholism and was also said to have committed the same kind of offense as his son. The mother and a sister suffered nervously. From ages of 7 to 18 the subject had epileptic convulsions. From 16 to 21 he indulged in normal sexual intercourse. At about that time he had often to pass a playground and at times would urinate there; it happened that the children watched him with curiosity. He noticed that when thus watched sexual excitement was caused, inducing erection and even ejaculation. He gradually found pleasure in this kind of sexual gratification; finally he became indifferent to

coitus. His
erotic dreams, though still usually about normal
coitus, were now
sometimes concerned with exhibition before little
girls. When
overcome by the impulse he could see and hear
nothing around him,
though he did not lose consciousness. After the act
was over he
was troubled by his deed. In all other respects he
was entirely
reasonable. He was imprisoned many times for
exhibiting himself
to young schoolgirls, sometimes vaunting the beauty
of his organs
and inviting inspection. On one occasion he
underwent mental
examination, but was considered to be mentally
sound. He was
finally held to be a hereditarily tainted individual
with
neuropathic constitution. The head was abnormally
broad, penis
small, patellar reflex absent, and there were many
signs of
neurasthenia. (Krafft-Ebing, *Op. cit.*, pp. 490-
492.)

The prevalence of epilepsy among exhibitionists is
shown by the
observations of Pelanda in Verona. He has recorded
six cases of
this perversion, all of which eventually reached the
asylum and
were either epileptics or with epileptic relations.
One had a
brother who was also an exhibitionist. In some cases
the penis
was abnormally large, in others abnormally small.
Several had
very weak sexual impulse; one, at the age of 62, had
never
effected coitus, and was proud of the fact that he
was still a
virgin, considering, he would say, the epoch of

demoralization in

which we live. (Pelanda, "Pornopatici," Archivio di Psichiatria, fasc. ii-iv, 1889.)

In a very typical case of exhibitionism which Garnier has recorded, a certain X., a gentleman engaged in business in Paris, had a predilection for exhibiting himself in churches, more especially in Saint-Roch. He was arrested several times for exposing his sexual organs here before ladies in prayer. In this way he finally ruined his commercial position in Paris and was obliged to establish himself in a small provincial town. Here again he soon exposed himself in a church and was again sent to prison, but on his liberation immediately performed the same act in the same church in what was described as a most imperturbable manner. Compelled to leave the town, he returned to Paris, and in a few weeks' time was again arrested for repeating his old offense in Saint Roch. When examined by Garnier, the information he supplied was vague and incomplete, and he was very embarrassed in the attempt to explain himself. He was unable to say why he chose a church, but he felt that it was to a church that he must go. He had, however, no thought of profanation and no wish to give offense. "Quite the contrary!" he declared. He had the sad and tired air of a man who is dominated by a force stronger than his will. "I know," he added, "what repulsion my conduct must inspire. Why am I made thus? Who will cure me?" (P.

Garnier,
"Perversions Sexuelles," Comptes Rendus,
International Congress
of Medicine at Paris in 1900, Section de
Psychiatrie, pp.
433-435.)

In some cases, it would appear, the impulse to exhibitionism may be overcome or may pass away. This result is the more likely to come about in those cases in which exhibitionism has been largely conditioned by chronic alcoholism or other influences tending to destroy the inhibiting and restraining action of the higher centers, which may be overcome by hygiene and treatment. In this connection I may bring forward a case which has been communicated to me by a medical correspondent in London. It is that of an actor, of high standing in his profession and extremely intelligent, 49 years of age, married and father of a large family. He is sexually vigorous and of erotic temperament. His general health has always been good, but he is a high-strung, neurotic man, with quick mental reactions. His habits had for a long time been decidedly alcoholic, but two years ago, a small quantity of albumen being found in the urine, he was persuaded to leave off alcohol, and has since been a teetotaler. Though ordinarily very reticent about sexual matters, he began four or five years ago to commit acts of exhibitionism, exposing himself to servants in the house and occasionally to women in the

country. This continued after the alcohol had been abandoned and lasted for several years, though the attention of the police was never attracted to the matter, and so far as possible he was quietly supervised by his friends. Nine months after, the acts of exhibitionism ceased, apparently in a spontaneous manner, and there has so far been no relapse.

Exhibitionism is an act which, on the face of it, seems nonsensical and meaningless, and as such, as an inexplicable act of madness, it has frequently been treated both by writers on insanity and on sexual perversion. "These acts are so lacking in common sense and intelligent reflection that no other reason than insanity can be offered for the patient," Ball concluded.[55] Moll, also, who defines exhibitionism somewhat too narrowly as a condition in which "the charm of the exhibition lies for the subject in the display itself," not sufficiently taking into consideration the imagined effect on the spectator, concludes that "the psychological basis of exhibitionism is at present by no means cleared up." [56]

We may probably best approach exhibitionism by regarding it as fundamentally a symbolic act based on a perversion of courtship. The exhibitionist displays the organ of sex to a feminine witness, and in the shock of modest sexual shame by which she reacts to that spectacle, he finds a gratifying similitude of the normal emotions of coitus.[57] He feels that he has effected a psychic defloration.

Exhibitionism is thus analogous, and, indeed, related, to the impulse felt by many persons to perform indecorous acts or tell indecent stories before young and innocent persons of the opposite sex. This is a kind of psychic exhibitionism, the gratification it causes lying exactly, as in physical exhibitionism, in the emotional confusion which it is felt to arouse. The two kinds of exhibitionism may be combined in the same person: Thus, in a case reported by Hoche (p. 97), the exhibitionist an intellectual and highly educated man, with a doctor's degree, also found pleasure in sending indecent poems and pictures to women, whom, however, he made no attempt to seduce; he was content with the thought of the emotions he aroused or believed that he aroused.

It is possible that within this group should come the agent in the following incident which was lately observed by a lady, a friend of my own. An elderly man in an overcoat was seen standing outside a large and well-known draper's shop in the outskirts of London; when able to attract the attention of any of the shop-girls or of any girl in the street he would fling back his coat and reveal that he was wearing over his own clothes a woman's chemise (or possibly bodice) and a woman's drawers; there was no exposure. The only intelligible explanation of this action

would seem to be that pleasure was experienced in the mild shock of interested surprise and injured modesty which this vision was imagined to cause to a young girl. It would thus be a comparatively innocent form of psychic defloration.

It is of interest to point out that the sexual symbolism of active flagellation is very closely analogous to this symbolism of exhibitionism.

The flagellant approaches a woman with the rod (itself a symbol of the penis and in some countries bearing names which are also applied to that organ) and inflicts on an intimate part of her body the signs of blushing and the spasmodic movements which are associated with sexual excitement, while at the same time she feels, or the flagellant imagines that she feels, the corresponding emotions of delicious shame.[58] This is an even closer mimicry of the sexual act than the exhibitionist attains, for the latter fails to secure the consent of the woman nor does he enjoy any intimate contact with her naked body. The difference is connected with the fact that the active flagellant is usually a more virile and normal person than the exhibitionist. In the majority of cases the exhibitionist's sexual impulse is very feeble, and as a rule he is either to some degree a degenerate, or else a person who is suffering from an early stage of general paralysis, dementia, or some other highly enfeebling cause of mental disorganization, such as chronic alcoholism. Sexual feebleness is further indicated by the fact that the individuals selected as witnesses are frequently mere children.

It seems probable that a form of erotic symbolism somewhat similar to exhibitionism is to be found in the rare cases in which sexual gratification is derived from throwing ink, acid or other defiling liquids on women's dresses. Thoinot has recorded a case of this kind (Attentats aux Moeurs, 1898, pp. 484, et seq.). An instructive case has been presented by Moll. In this case a young man of somewhat neuropathic heredity had as a youth of 16 or 17, when romping with his young sister's playfellows, experienced sexual sensations on chancing to see their white underlinen. From that time white underlinen and white dresses became to him a fetich and he was only attracted to women so attired. One day, at the age of 25, when crossing the street in wet weather with a young lady in a white dress, a passing vehicle splashed the dress with mud. This incident caused him strong sexual excitement, and from that time he had the impulse to throw ink, perchloride of iron, etc., on to ladies' white dresses, and sometimes to cut and tear them, sexual excitement and ejaculation taking place every time he effected this. (Moll, "Gutachten über einem Sexual Perversen [Besudelungstrieb]," Zeitschrift für Medizinalbeamte, Heft XIII, 1900). Such a case is of considerable psychological interest. Thoinot considers that in these cases the fleck is a fetich. That is an incorrect account

of the matter. In this case the white garments constituted the primary fetich, but that fetich becomes more acutely realized, and at the same time both parties are thrown into an emotional state which to the fetichist becomes a mimicry of coitus, by the act of defilement. We may perhaps connect with this phenomenon the attraction which muddy shoes often exert over the shoe-fetichist, and the curious way in which, as we have seen (p. 18), Restif de la Bretonne associates his love of neatness in women with his attraction to the feet, the part, he remarks, least easy to keep clean.

Garnier applied the term sadi-fetichism to active flagellation and many similar manifestations such as we are here concerned with, on the grounds that they are hybrids which combine the morbid adoration for a definite object with the impulse to exercise a more or less degree of violence. From the standpoint of the conception of erotic symbolism I have adopted there is no need for this term. There is here no hybrid combination of two unlike mental states. We are simply concerned with states of erotic symbolism, more or less complete, more or less complex.

The conception of exhibitionism as a process of erotic symbolism, involves a conscious or unconscious attitude of attention in the exhibitionist's mind to the psychic reaction of the woman toward whom his display is

directed. He seeks to cause an emotion which, probably in most cases, he desires should be pleasurable. But from one cause or another his finer sensibilities are always inhibited or in abeyance, and he is unable to estimate accurately either the impression he is likely to produce or the general results of his action, or else he is moved by a strong impulsive obsession which overpowers his judgment. In many cases he has good reason for believing that his act will be pleasurable, and frequently he finds complacent witnesses among the low-class servant girls, etc.

It may be pointed out here that we are quite justified in speaking of a penis-fetichism and also of a vulva-fetichism. This might be questioned. We are obviously justified in recognizing a fetichism which attaches itself to the pubic hair, or, as in a case with which I am acquainted, to the clitoris, but it may seem that we cannot regard the central sexual organs as symbols of sex, symbols, as it were, of themselves. Properly regarded, however, it is the sexual act rather than the sexual organ which is craved in normal sexual desire; the organ is regarded merely as the means and not as the end. Regarded as a means the organ is indeed an object of desire, but it only becomes a fetich when it arrests and fixes the attention. An attention thus pleasurably fixed, a vulva-fetichism or a penis-fetichism, is within the normal range of sexual emotion (this point has been mentioned in

the previous volume when discussing the part played by the primary sexual organs in sexual selection), and in coarse-grained natures of either sex it is a normal allurement in its generalized shape, apart from any attraction to the person to whom the organs belong. In some morbid cases, however, this penis-fetichism may become a fully developed sexual perversion. A typical case of this kind has been recorded by Howard in the United States. Mrs. W., aged 39, was married at 20 to a strong, healthy man, but derived no pleasure from coitus, though she received great pleasure from masturbation practiced immediately after coitus, and nine years after marriage she ceased actual coitus, compelling her husband to adopt mutual masturbation. She would introduce men into the house at all times of the day or night, and after persuading them to expose their persons would retire to her room to masturbate. The same man never aroused desire more than once. This desire became so violent and persistent that she would seek out men in all sorts of public places and, having induced them to expose themselves, rapidly retreat to the nearest convenient spot for self-gratification. She once abstracted a pair of trousers she had seen a man wear and after fondling them experienced the orgasm. Her husband finally left her, after vainly attempting to have her confined in an asylum. She was often arrested for her actions,

but through
the intervention of friends set free again. She was
a highly
intelligent woman, and apart from this perversion
entirely
normal. (W.L. Howard, "Sexual Perversion," Alienist
and
Neurologist, January, 1896.) It is on the existence
of a more or
less developed penis-fetichism of this kind that the
exhibitionist, mostly by an ignorant instinct,
relies for the
effects he desires to produce.

The exhibitionist is not usually content to produce a
mere titillated
amusement; he seeks to produce a more powerful effect
which must be
emotional whether or not it is pleasurable. A
professional man in
Strassburg (in a case reported by Hoche[59]) would walk
about in the
evening in a long cloak, and when he met ladies would
suddenly throw his
cloak back under a street lamp, or igniting a red-fire
match, and thus
exhibit his organs. There was an evident effort--on the
part of a weak,
vain, and effeminate man--to produce a maximum of
emotional effect. The
attempt to heighten the emotional shock is also seen in
the fact that the
exhibitionist frequently chooses a church as the scene
of his exploits,
not during service, for he always avoids a concourse of
people, but
perhaps toward evening when there are only a few
kneeling women scattered
through the edifice. The church is chosen, often
instinctively rather than
deliberately, from no impulse to commit a sacrilegious
outrage--which, as
a rule, the exhibitionist does not feel his act to be--
but because it
really presents the conditions most favorable to the act

and the effects
desired. The exhibitionist's attitude of mind is well
illustrated by one
of Garnier's patients who declared that he never wished
to be seen by more
than two women at once, "just what is necessary," he
added, "for an
exchange of impressions." After each exhibition he would
ask himself
anxiously: "Did they see me? What are they thinking?
What do they say to
each other about me? Oh! how I should like to know!"
Another patient of
Garnier's, who haunted churches for this purpose, made
this very
significant statement: "Why do I like going to churches?
I can scarcely
say. _But I know that it is only there that my act has
its full
importance_. The woman is in a devout frame of mind, and
she must see that
such an act in such a place is not a joke in bad taste
or a disgusting
obscenity; _that if I go there it is not to amuse
myself; it is more
serious than that!_ I watch the effect produced on the
faces of the ladies
to whom I show my organs. I wish to see them express a
profound joy. I
wish, in fact, that they may be forced to say to
themselves: _How
impressive Nature is when thus seen!_"

Here we trace the presence of a feeling which
recalls the
phenomena of the ancient and world-wide phallic
worship, still
liable to reappear sporadically. Women sometimes
took part in
these rites, and the osculation of the male sexual
organ or its
emblematic representation by women is easily
traceable in the
phallic rites of India and many other lands, not
excluding Europe

even in comparatively recent times. (Dulaure in his
_Divinités

Génératives brings together much bearing on these
points; cf.:

Ploss and Bartels, _Das Weib_, vol. i, Chapter XVII,
and Bloch,

Beiträge zur Psychopathia Sexualis, Teil I, pp.
115-117. Colin

Scott has some interesting remarks on phallic
worship and the

part it has played in aiding human evolution, "Sex
and Art,"

American Journal of Psychology, vol. vii, No. 2,
pp. 191-197.

Irving Rosse describes some modern phallic rites in
which both

men and women took part, similar to those practiced
in vaudouism,

"Sexual Hypochondriasis," _Virginia Medical
Monthly_, October,
1892.)

Putting aside any question of phallic worship, a
certain pride

and more or less private feeling of ostentation in
the new

expansion and development of the organs of virility
seems to be

almost normal at adolescence. "We have much reason
to assume,"

Stanley Hall remarks, "that in a state of nature
there is a

certain instinctive pride and ostentation that
accompanies the

new local development. I think it will be found that
exhibitionists are usually those who have excessive
growth here,

and that much that modern society stigmatizes as
obscene is at

bottom more or less spontaneous and perhaps in some
cases not

abnormal. Dr. Seerley tells me he has never examined
a young man

largely developed who had the usual strong
instinctive tendency

of modesty to cover himself with his hands, but he finds this instinct general with those whose development is less than the average." (G. Stanley Hall, *Adolescence*, vol. ii, p. 97.) This instinct of ostentation, however, so far as it is normal, is held in check by other considerations, and is not, in the strict sense, exhibitionism. I have observed a full-grown telegraph boy walking across Hampstead Heath with his sexual organs exposed, but immediately he realized that he was seen he concealed them. The solemnity of exhibitionism at this age finds expression in the climax of the sonnet, "Oraison du Soir," written at 16 by Rimbaud, whose verse generally is a splendid and insolent manifestation of rank adolescence:--

"Doux comme le Seigneur du cèdre et des hysopes,
Je pisse vers les cieux bruns très haut et très
loin,
Avec l'assentiment des grands héliotropes."

(J.A. Rimbaud, *Oeuvres*, p. 68.)

In women, also, there would appear to be traceable a somewhat similar ostentation, though in them it is complicated and largely inhibited by modesty, and at the same time diffused over the body owing to the absence of external sexual organs. "Primitive woman," remarks Madame Renooz, "proud of her womanhood, for a long time defended her nakedness which ancient art has always represented. And in the actual life of the young girl to-day

there is a moment when by a secret atavism she feels the pride of her sex, the intuition of her moral superiority, and cannot understand why she must hide its cause. At this moment, wavering between the laws of Nature and social conventions, she scarcely knows if nakedness should or should not affright her. A sort of confused atavistic memory recalls to her a period before clothing was known, and reveals to her as a paradisaical ideal the customs of that human epoch." (Céline Renooz, *Psychologie Comparée de l'Homme et de la Femme*, p. 85.) It may be added that among primitive peoples, and even among some remote European populations to-day, the exhibition of feminine nudity has sometimes been regarded as a spectacle with religious or magic operation. (Ploss, *Das Weib*, seventh edition, vol. ii, pp. 663-680; Havelock Ellis, *Man and Woman*, fourth edition, p. 304.) It is stated by Gopcevic that in the long struggle between the Albanians and the Montenegrins the women of the former people would stand in the front rank and expose themselves by raising their skirts, believing that they would thus insure victory. As, however, they were shot down, and as, moreover, victory usually fell to the Montenegrins, this custom became discredited. (Quoted by Bloch, *Op. cit.*, Teil II, p. 307.)

With regard to the association, suggested by Stanley Hall,

between exhibitionism and an unusual degree of development of the sexual organs, it must be remarked that both extremes--a very large and a very small penis--are specially common in exhibitionists. The prevalence of the small organ is due to an association of exhibitionism with sexual feebleness. The prevalence of the large organ may be due to the cause suggested by Hall. Among Mahomedans the sexual organs are sometimes habitually exposed by religious penitents, and I note that Bernhard Stern, in his book on the medical and sexual aspects of life in Turkey, referring to a penitent of this sort whom he saw on the Stamboul bridge at Constantinople, remarks that the organ was very largely developed. It may well be in such a case that the penitent's religious attitude is reinforced by some lingering relic of a more fleshly ostentation.

It is by a pseudo-atavism that this phallicism is evoked in the exhibitionist. There is no true emergence of an ancestrally inherited instinct, but by the paralysis or inhibition of the finer and higher feelings current in civilization, the exhibitionist is placed on the same mental level as the man of a more primitive age, and he thus presents the basis on which the impulses belonging to a higher culture may naturally take root and develop.

Reference may here be made to a form of primitive exhibitionism, almost confined to women, which, although certainly

symbolic, is
absolutely non-sexual, and must not, therefore, be
confused with
the phenomena we are here occupied with. I refer to
the
exhibition of the buttocks as a mark of contempt. In
its most
primitive form, no doubt, this exhibitionism is a
kind of
exorcism, a method of putting evil spirits,
primarily, and
secondarily evil-disposed persons, to flight. It is
the most
effective way for a woman to display sexual centers,
and it
shares in the magical virtues which all unveiling of
the sexual
centers is believed by primitive peoples to possess.
It is
recorded that the women of some peoples in the
Balkan peninsula
formerly used this gesture against enemies in
battle. In the
sixteenth century so distinguished a theologian as
Luther when
assailed by the Evil One at night was able to put
the adversary
to flight by protruding his uncovered buttocks from
the bed. But
the spiritual significance of this attitude is lost
with the
decay of primitive beliefs. It survives, but merely
as a gesture
of insult. The symbolism comes to have reference to
the nates as
the excretory focus, the seat of the anus. In any
case it ignores
any sexual attractiveness in this part of the body.
Exhibitionism
of this kind, therefore, can scarcely arise in
persons of any
sensitiveness or æsthetic perception, even putting
aside the
question of modesty, and there seems to be little
trace of it in

classic antiquity when the nates were regarded as objects of beauty. Among the Egyptians, however, we gather from Herodotus (Bk. II, Chapter LX) that at a certain popular religious festival men and women would go in boats on the Nile, singing and playing, and when they approached a town the women on the boats would insult the women of the town by injurious language and by exposing themselves. Among the Arabs, however, the specific gesture we are concerned with is noted, and a man to whom vengeance is forbidden would express his feelings by exposing his posterior and strewing earth on his head (Wellhausen, *Rests Arabischen Heidentums*, 1897, p. 195). It is in Europe and in mediæval and later times that this emphatic gesture seems to have flourished as a violent method of expressing contempt. It was by no means confined to the lower classes, and Kleinpaul, in discussing this form of "speech without words," quotes examples of various noble persons, even princesses, who are recorded thus to have expressed their feelings. (Kleinpaul, *Sprache ohne Worte*, pp. 271-273.) In more recent times the gesture has become merely a rare and extreme expression of unrestrained feeling in coarse-grained peasants. Zola, in the figure of Mouquette in *Germinal*, may be said to have given a kind of classic expression to the gesture. In the more remote parts of Europe it appears to be still not altogether uncommon. This

seems to be

notably the case among the South Slavs, and Krauss states that

"when a South Slav woman wishes to express her deepest contempt

for anyone she bends forward, with left hand raising her skirts,

and with the right slapping her posterior, at the same time

exclaiming: 'This for you!'" (Kryptadia, vol. vi, p. 200.)

A verbal survival of this gesture, consisting in the contemptuous

invitation to kiss this region, still exists among us in remote

parts of the country, especially as an insult offered by an angry

woman who forgets herself. It is said to be commonly used in

Wales. ("Welsh Ædoelogy," Kryptadia, vol. ii, pp. 358, et seq.)

In Cornwall, when addressed by a woman to a man it is sometimes

regarded as a deadly insult, even if the woman is young and

attractive, and may cause a life-long enmity between related

families. From this point of view the nates are a symbol of

contempt, and any sexual significance is excluded.

(The

distinction is brought out by Diderot in *_Le Neveu de Rameau_*:

"_Lui:_--Il y a d'autres jours ou il ne m'en coûterait rien pour

être vil tant qu'on voudrait; ces jours-là, pour un liard, je

baiserais le cul à la petite Hus. *_Moi:_*--Eh! mais, l'ami, elle

est blanche, jolie, douce, potelée, et c'est un acte d'humilité

auquel un plus délicat que vous pourrait quelquefois s'abaisser.

Lui:--Entendons-nous; c'est qu'il y a baiser le

cul au simple,
et baiser le cul au figuré.")

It must be added that a sexual form of exhibitionism of the nates must still be recognized. It occurs in masochism and expresses the desire for passive flagellation. Rousseau, whose emotional life was profoundly affected by the castigations which as a child he received from Mlle Lambercier, has in his Confessions told us how, when a youth, he would sometimes expose himself in this way in the presence of young women. Such masochistic exhibitionism seems, however, to be rare.

While the manifestations of exhibitionism are substantially the same in all cases, there are many degrees and varieties of the condition. We may find among exhibitionists, as Garnier remarks, dementia, states of unconsciousness, epilepsy, general paralysis, alcoholism, but the most typical cases, he adds, if not indeed the cases to which the term properly belongs, are those in which it is an impulsive obsession. Krafft-Ebing[60] divides exhibitionists into four clinical groups: (1) acquired states of mental weakness, with cerebral or spinal disease clouding consciousness and at the same time causing impotence; (2) epileptics, in whom the act is an abnormal organic impulse performed in a state of imperfect consciousness; (3) a somewhat allied group of neurasthenic cases; (4) periodical impulsive cases with deep hereditary taint. This classification is not altogether satisfactory. Garnier's classification, placing the group of obsessional cases in the foreground and leaving

the other more vaguely defined groups in the background, is probably better. I am inclined to consider that most of the cases fall into one or other of two mixed groups. The first class includes cases in which there is more or less congenital abnormality, but otherwise a fair or even complete degree of mental integrity; they are usually young adults, they are more or less precisely conscious of the end they wish to attain, and it is often only with a severe struggle that they yield to their impulses. In the second class the beginnings of mental or nervous disease have diminished the sensibility of the higher centers; the subjects are usually old men whose lives have been absolutely correct; they are often only vaguely aware of the nature of the satisfaction they are seeking, and frequently no struggle precedes the manifestation; such was the case of the overworked clergyman described by Hughes,[61] who, after much study, became morose and absent-minded, and committed acts of exhibitionism which he could not explain but made no attempt to deny; with rest and restorative treatment his health improved and the acts ceased. It is in the first class of cases alone that there is a developed sexual perversion. In the cases of the second class there is a more or less definite sexual intention, but it is only just conscious, and the emergence of the impulse is due not to its strength but to the weakness, temporary or permanent, of the higher inhibiting centers.

Epileptic cases, with loss of consciousness during the act, can only be

regarded as presenting a pseudo-exhibitionism. They should be excluded altogether. It is undoubtedly true that many cases of real or apparent exhibitionism occur in epileptics.[62] We must not, however, too hastily conclude that because these acts occur in epileptics they are necessarily unconscious acts. Epilepsy frequently occurs on a basis of hereditary degeneration, and the exhibitionism may be, and not infrequently is, a stigma of the degeneracy and not an indication of the occurrence of a minor epileptic fit. When the act of pseudo-exhibitionism is truly epileptic, it will usually have no psychic sexual content, and it will certainly be liable to occur under all sorts of circumstances, when the patient is alone or in a miscellaneous concourse of people. It will be on a level with the acts of the highly respectable young woman who, at the conclusion of an attack of petit mal, consisting chiefly of a sudden desire to pass urine, on one occasion lifted up her clothes and urinated at a public entertainment, so that it was with difficulty her friends prevented her from being handed over to the police.[63] Such an act is automatic, unconscious, and involuntary; the spectators are not even perceived; it cannot be an act of exhibitionism. Whenever, on the other hand, the place and the time are evidently chosen deliberately,--a quiet spot, the presence of only one or two young women or children,--it is difficult to admit that we are in the presence of a fit of epileptic unconsciousness, even when the subject is known to be epileptic.

Even, however, when we exclude those epileptic pseudo-exhibitionists who, from the legal point of view, are clearly irresponsible, it must still be remembered that in every case of exhibitionism there is a high degree of either mental abnormality on a neuropathic basis, or else of actual disease. This is true to a greater extent in exhibitionism than in almost any other form of sexual perversion. No subject of exhibitionism should be sent to prison without expert medical examination.

FOOTNOTES:

[54] Lasège first drew attention to this sexual perversion and gave it its generally accepted name, "Les Exhibitionistes," L'Union Médicale, May, 1877. Magnan, on various occasions (for example, "Les Exhibitionistes," Archives de l'Anthropologie Criminelle, vol. v, 1890, p. 456), has given further development and precision to the clinical picture of the exhibitionist.

[56] Moll, Untersuchungen über die Libido Sexualis, bd. i, p. 661.

[57] "Exhibitionism in its most typical form is," Garnier truly says, "a systematic act, manifesting itself as the strange equivalent of a sexual connection, or its substitution." The brief account of exhibitionism (pp. 433-437) in Garnier's discussion of "Perversions Sexuelles" at the International Medical Congress at Paris in 1900 (Section de Psychiatrie: Comptes-Rendus) is the most

satisfactory
statement of the psychological aspects of this
perversion with which I am
acquainted. Garnier's unrivalled clinical knowledge of
these
manifestations, due to his position during many years as
physician at the
Depôt of the Prefecture of Police in Paris, adds great
weight to his
conclusions.

[58] The symbolism of coitus involved in flagellation
has been touched on
by Eulenburg (*_Sexuale Neuropathie_*, p. 121), and is
more fully developed
by Dühren (*_Geschlechtsleben in England_*, bd. ii, pp.
366, *_et seq._*).

VI.

The Forms of Erotic Symbolism are Simulacra of Coitus--

Wide

Extension of Erotic Symbolism--Fetichism Not Covering
the Whole
Ground of Sexual Selection--It is Based on the
Individual Factor in
Selection--Crystallization--The Lover and the Artist--
The Key to Erotic
Symbolism to be Found in the Emotional Sphere--The
Passage to Pathological
Extremes.

We have now examined several very various and yet very
typical
manifestations in all of which it is not difficult to
see how, in some
strange and eccentric form--on a basis of association
through resemblance
or contiguity or both combined--there arises a definite
mimicry of the
normal sexual act together with the normal emotions
which accompany that
act. It has become clear in what sense we are justified
in recognizing
erotic symbolism.

The symbolic and, as it were, abstracted nature of
these
manifestations is shown by the remarkable way in
which they are
sometimes capable of transference from the object to
the subject.

That is to say that the fetichist may show a
tendency to
cultivate his fetich in his own person. A foot-
fetichist may like
to go barefoot himself; a man who admired lame women
liked to
halt himself; a man who was attracted by small
waists in women
found sexual gratification in tight-lacing himself;
a man who was
fascinated by fine white skin and wished to cut it
found
satisfaction in cutting his own skin; Moll's

coprolagnic

fetichist found a voluptuous pleasure in his own acts of defecation. (See, e.g., Krafft-Ebing, *Op. cit.*, p. 221, 224, 226; Hammond, *Sexual Impotence*, p. 74; cf. *ante*, p. 68.) Such symbolic transference seems to have a profoundly natural basis, for we may see a somewhat similar phenomenon in the well-known tendency of cows to mount a cow in heat. This would appear to be, not so much a homosexual impulse, as the dynamic psychic action of an olfactory sexual symbol in a transformed form.

We seem to have here a psychic process which is a curious reversal of that process of *Einfühlung*--the projection of one's own activities into the object contemplated--which Lipps has so fruitfully developed as the essence of every æsthetic condition. (T. Lipps, *Æsthetik*, Teil I, 1903.) By *Einfühlung* our own interior activity becomes the activity of the object perceived, a thing being beautiful in proportion as it lends itself to our *Einfühlung*. But by this action of erotic symbolism, on the other hand, we transfer the activity of the object into ourselves.

When the idea of erotic symbolism as manifested in such definite and typical forms becomes realized, it further becomes clear that the vaguer manifestations of such symbolism are exceedingly widespread. When in a previous volume we were discussing and drawing together the various

threads which unite "Love and Pain," it will now be understood that we were standing throughout on the threshold of erotic symbolism. Pain itself, in the sense in which we slowly learned to define it in this relationship--as a state of intense emotional excitement--may, under a great variety of special circumstances, become an erotic symbol and afford the same relief as the emotions normally accompanying the sexual act. Active algolagnia or sadism is thus a form of erotic symbolism; passive algolagnia or masochism is (in a man) an inverted form of erotic symbolism. Active flagellation or passive flagellation are, in exactly the same way, manifestations of erotic symbolism, the imaginative mimicry of coitus.

Binet and also Krafft-Ebing[64] have argued in effect that the whole of sexual selection is a matter of fetichism, that is to say, of erotic symbolism of object. "Normal love," Binet states, "appears as the result of a complicated fetichism." Tarde also seems to have regarded love as normally a kind of fetichism. "We are a long time before we fall in love with a woman," he remarks; "we must wait to see the detail which strikes and delights us, and causes us to overlook what displeases us. Only in normal love the details are many and always changing. Constancy in love is rarely anything else but a voyage around the beloved person, a voyage of exploration and ever new discoveries. The most faithful lover does not love the same woman in the same way for two days in succession." [65]

From that point of view normal sexual love is the sway of a fetich--more or less arbitrary, more or less (as Binet terms it) polytheistic--and it can have little objective basis. But, as we saw when considering "Sexual Selection in Man" in the previous volume, more especially when analyzing the notion of beauty, we are justified in believing that beauty has to a large extent an objective basis, and that love by no means depends simply on the capricious selection of some individual fetich. The individual factor, as we saw, is but one of many factors which constitute beauty. In the study of sexual selection that individual factor was passed over very lightly. We now see that it is often a factor of great importance, for in it are rooted all these outgrowths--normal in their germs, highly abnormal in their more extreme developments--which make up erotic symbolism.

Erotic symbolism is therefore concerned with all that is least generic, least specific, all that is most intimately personal and individual, in sexual selection. It is the final point in which the decreasing circle of sexual attractiveness is fixed. In the widest and most abstract form sexual selection in man is merely human, and we are attracted to that which bears most fully the marks of humanity; in a less abstract form it is sexual, and we are attracted to that which most vigorously presents the secondary sexual characteristics; still narrowing, it is the type of our own nation and people that appeals most strongly to us in matters of love; and still further concentrating we are affected by the ideal--in

civilization most often the somewhat exotic ideal--of our own day, the fashion of our own city. But the individual factor still remains, and amid the infinite possibilities of erotic symbolism the individual may evolve an ideal which is often, as far as he knows and perhaps in actuality, an absolutely unique event in the history of the human soul.

Erotic symbolism works in its finer manifestations by means of the idealizing aptitudes; it is the field of sexual psychology in which that faculty of crystallization, on which Stendhal loved to dwell, achieves its most brilliant results. In the solitary passage in which we seem to see a smile on the face of the austere poet of the *_De Rerum Naturâ_*, Lucretius tells us how every lover, however he may be amused by the amorous extravagances of other men, is himself blinded by passion: if his mistress is black she is a fascinating brunette, if she squints she is the rival of Pallas, if too tall she is majestic, if too short she is one of the Graces, *_tota merum sal_*; if too lean it is her delicate refinement, if too fat then a Ceres, dirty and she disdains adornment, a chatterer and brilliantly vivacious, silent and it is her exquisite modesty.[66] Sixteen hundred years later Robert Burton, when describing the symptoms of love, made out a long and appalling list of the physical defects which the lover is prepared to admire.[67]

Yet we must not be too certain that the lover is wrong in this matter. We too hastily assume that the casual and hasty judgment of the world is

necessarily more reliable, more conformed to what we call "truth," than the judgment of the lover which is founded on absorbed and patient study. In some cases where there is lack of intelligence in the lover and dissimulation in the object of his love, it may be so. But even a poem or a picture will often not reveal its beauty except by the expenditure of time and study. It is foolish to expect that the secret beauty of a human person will reveal itself more easily. The lover is an artist, an artist who constructs an image, it is true, but only by patient and concentrated attention to nature; he knows the defects of his image, probably better than anyone, but he knows also that art lies, not in the avoidance of defects, but in the realization of those traits which swallow up defects and so render them non-existent. A great artist, Rodin, after a life spent in the study of Nature, has declared that for art there is no ugliness in Nature. "I have arrived at this belief by the study of Nature," he said; "I can only grasp the beauty of the soul by the beauty of the body, but some day one will come who will explain what I only catch a glimpse of and will declare how the whole earth is beautiful, and all human beings beautiful. I have never been able to say this in sculpture so well as I wish and as I feel it affirmed within me. For poets Beauty has always been some particular landscape, some particular woman; but it should be all women, all landscapes. A negro or a Mongol has his beauty, however remote from ours, and it must be the same with their characters. There is no ugliness. When I was young I made that mistake, as

others do; I could
not undertake a woman's bust unless I thought her
pretty, according to my
particular idea of beauty; to-day I should do the bust
of any woman, and
it would be just as beautiful. And however ugly a woman
may look, when she
is with her lover she becomes beautiful; there is beauty
in her character,
in her passions, and beauty exists as soon as character
or passion becomes
visible, for the body is a casting on which passions are
imprinted. And
even without that, there is always the blood that flows
in the veins and
the air that fills the lungs." [68]

The saint, also, is here at one with the lover and the
artist. The man who
has so profoundly realized the worth of his fellow men
that he is ready
even to die in order to save them, feels that he has
discovered a great
secret. Cyples traces the "secret delights" that have
thus risen in the
hearts of holy men to the same source as the feelings
generated between
lovers, friends, parents, and children. "A few have at
intervals walked in
the world," he remarks, "who have, each in his own
original way, found out
this marvel.... Straightway man in general has become to
them so sweet a
thing that the infatuation has seemed to the rest of
their fellows to be a
celestial madness. Beggars' rags to their unhesitating
lips grew fit for
kissing, because humanity had touched the garb; there
were no longer any
menial acts, but only welcome services.... Remember by
how much man is the
subtlest circumstance in the world; at how many points
he can attach
relationships; how manifold and perennial he is in his
results. All other

things are dull, meager, tame beside him." [69]

It may be added that even if we still believe that lover and artist and saint are drawing the main elements of their conceptions from the depths of their own consciousness, there is a sense in which they are coming nearer to the truth of things than those for whom their conceptions are mere illusions. The aptitude for realizing beauty has involved an adjustment of the nerves and the associated brain centers through countless ages that began before man was. When the vision of supreme beauty is slowly or suddenly realized by anyone, with a reverberation that extends throughout his organism, he has attained to something which for his species, and for far more than his species, is truth, and can only be illusion to one who has artificially placed himself outside the stream of life.

In an essay on "The Gods as Apparitions of the Race-Life," Edward Carpenter, though in somewhat Platonic phraseology, thus well states the matter: "The youth sees the girl; it may be a chance face, a chance outline, amid the most banal surroundings. But it gives the cue. There is a memory, a confused reminiscence. The mortal figure without penetrates to the immortal figure within, and there rises into consciousness a shining form, glorious, not belonging to this world, but vibrating with the agelong life of humanity, and the memory of a thousand love-dreams. The waking of this vision intoxicates the man; it glows and burns

within him; a
goddess (it may be Venus herself) stands in the
sacred place of
his temple; a sense of awe-struck splendor fills
him, and the
world is changed." "He sees something" (the same
writer continues
in a subsequent essay, "Beauty and Duty") "which, in
a sense, is
more real than the figures in the street, for he
sees something
that has lived and moved for hundreds of years in
the heart of
the race; something which has been one of the great
formative
influences of his own life, and which has done as
much to create
those very figures in the street as qualities in the
circulation
of the blood may do to form a finger or other limb.
He comes into
touch with a very real Presence or Power--one of
those organic
centers of growth in the life of humanity--and feels
this larger
life within himself, subjective, if you like, and
yet intensely
objective. And more. For is it not also evident that
the woman,
the mortal woman who excites his Vision, has some
closest
relation to it, and is, indeed, far more than a mere
mask or
empty formula which reminds him of it? For she
indeed has within
her, just as much as the man has, deep subconscious
Powers
working; and the ideal which has dawned so
entrancingly on the
man is in all probability closely related to that
which has been
working most powerfully in the heredity of the
woman, and which
has most contributed to mold her form and outline.
No wonder,

then, that her form should remind him of it. Indeed, when he

looks into her eyes he sees through to a far deeper life even

than she herself may be aware of, and yet which is truly hers--a

life perennial and wonderful. The more than mortal in him beholds

the more than mortal in her; and the gods descend to meet."

(Edward Carpenter, The Art of Creation, pp. 137, 186.)

It is this mighty force which lies behind and beneath the aberrations we have been concerned with, a great reservoir from which they draw the life-blood that vivifies even their most fantastic shapes. Fetichism and the other forms of erotic symbolism are but the development and the isolation of the crystallizations which normally arise on the basis of sexual selection. Normal in their basis, in their extreme forms they present the utmost pathological aberrations of the sexual instinct which can be attained or conceived. In the intermediate space all degrees are possible. In the slightest degree the symbol is merely a specially fascinating and beloved feature in a person who is, in all other respects, felt to be lovable; as such its recognition is a legitimate part of courtship, an effective aid to tumescence. In a further degree the symbol is the one arresting and attracting character of a person who must, however, still be felt as a sexually attractive individual. In a still further degree of perversion the symbol is effective, even though the person with whom it is associated is altogether unattractive. In the final

stage the person and even all association with a person disappear altogether from the field of sexual consciousness; the abstract symbol rules supreme.

Long, however, before the symbol has reached that final climax of morbid intensity we may be said to have passed beyond the sphere of sexual love. A person, not an abstracted quality, must be the goal of love. So long as the fetich is subordinated to the person it serves to heighten love. But love must be based on a complexus of attractive qualities, or it has no stability.[70] As soon as the fetich becomes isolated and omnipotent, so that the person sinks into the background as an unimportant appendage of the fetich, all stability is lost. The fetichist now follows an impersonal and abstract symbol withersoever it may lead him.

It has been seen that there are an extraordinary number of forms in which erotic symbolism may be felt. It must be remembered, and it cannot be too distinctly emphasized, that the links that bind together the forms of erotic symbolism are not to be found in objects or even in acts, but in the underlying emotion. A feeling is the first condition of the symbol, a feeling which recalls, by a subtle and unconscious automatic association of resemblance or of contiguity, some former feeling. It is the similarity of emotion, instinctively apprehended, which links on a symbol only partially sexual, or even apparently not sexual at all, to the great central focus of sexual emotion, the great dominating force which brings the symbol its life-blood.[71]

The cases of sexual hyperæsthesia, quoted at the beginning of this study, do but present in a morbidly comprehensive and sensitive form those possibilities of erotic symbolism which, in some degree, or at some period, are latent in most persons. They are genuinely instinctive and automatic, and have nothing in common with that fanciful and deliberate play of the intelligence around sexual imagery--not infrequently seen in abnormal and insane persons--which has no significance for sexual psychology.

It is to the extreme individualization involved by the developments of erotic symbolism that the fetichist owes his morbid and perilous isolation. The lover who is influenced by all the elements of sexual selection is always supported by the fellow-feeling of a larger body of other human beings; he has behind him his species, his sex, his nation, or at the very least a fashion. Even the inverted lover in most cases is soon able to create around him an atmosphere constituted by persons whose ideals resemble his own. But it is not so with the erotic symbolist. He is nearly always alone. He is predisposed to isolation from the outset, for it would seem to be on a basis of excessive shyness and timidity that the manifestations of erotic symbolism are most likely to develop. When at length the symbolist realizes his own aspirations--which seem to him for the most part an altogether new phenomenon in the world--and at the same time realizes the wide degree in which they deviate from those of the rest

of mankind, his natural secretiveness is still further reinforced. He stands alone. His most sacred ideals are for all those around him a childish absurdity, or a disgusting obscenity, possibly a matter calling for the intervention of the policeman. We have forgotten that all these impulses which to us seem so unnatural--this adoration of the foot and other despised parts of the body, this reverence for the excretory acts and products, the acceptance of congress with animals, the solemnity of self-exhibition--were all beliefs and practices which, to our remote forefathers, were bound up with the highest conceptions of life and the deepest ardors of religion.

A man cannot, however, deviate at once so widely and so spontaneously in his impulses from the rest of the world in which he himself lives without possessing an aboriginally abnormal temperament. At the very least he exhibits a neuropathic sensitiveness to abnormal impressions. Not infrequently there is more than this, the distinct stigmata of degeneration, sometimes a certain degree of congenital feeble-mindedness or a tendency to insanity.

Yet, regarded as a whole, and notwithstanding the frequency with which they witness to congenital morbidity, the phenomena of erotic symbolism can scarcely fail to be profoundly impressive to the patient and impartial student of the human soul. They often seem absurd, sometimes disgusting, occasionally criminal; they are always, when carried to an extreme degree, abnormal. But of all the manifestations of sexual

psychology, normal and abnormal, they are the most specifically human. More than any others they involve the potently plastic force of the imagination. They bring before us the individual man, not only apart from his fellows, but in opposition, himself creating his own paradise. They constitute the supreme triumph of human idealism.

[69] W. Cyples, *_The Process of Human Experience_*, p. 462. Even if (as we have already seen, *_ante_*, p. 58) the saint cannot always feel actual physical pleasure in the intimate contact of humanity, the ardor of devoted service which his vision of humanity arouses remains unaffected.

[70] "To love," as Stendhal defined it (*_De l'Amour_*,

Chapter II), "is to have pleasure in seeing, touching, and feeling by all the senses, and as near as possible, a beloved object by whom one is oneself loved."

[71] Pillon's study of "La Mémoire Affective" (_Revue Philosophique_, February, 1901) helps to explain the psychic mechanism of the process.

THE MECHANISM OF DETUMESCENCE.

I.

The Psychological Significance of Detumescence--The Testis and the Ovary--Sperm Cell and Germ Cell--Development of the Embryo--The External Sexual Organs--Their Wide Range of Variation--Their Nervous Supply--The Penis--Its Racial Variations--The Influence of Exercise--The Scrotum and Testicles--The Mons Veneris--The Vulva--The Labia Majora and their Varieties--The Pubic Hair and Its Characters--The Clitoris and Its Functions--The Anus as an Erogenous Zone--The Nymphæ and their Function--The Vagina--The Hymen--Virginity--The Biological Significance of the Hymen.

In analyzing the sexual impulse we have seen that the process whereby the conjunction of the sexes is achieved falls naturally into two phases: the first phase, of tumescence, during which force is generated in the organism, and the second phase, of detumescence, in which that force is

discharged during conjugation.[72] Hitherto we have been occupied mainly with the first phase, that of tumescence, and with its associated psychic phenomena. It was inevitable that this should be so, for it is during the slow process of tumescence that sexual selection is decided, the crystallizations of love elaborated, and, to a large extent, the individual erotic symbols determined. But we can by no means altogether pass over the final phase of detumescence. Its consideration, it is true, brings us directly into the field of anatomy and physiology; while tumescence is largely under control of the will, when the moment of detumescence arrives the reins slip from the control of the will; the more fundamental and uncontrollable impulses of the organism gallop on unchecked; the chariot of Phaëthon dashes blindly down into a sea of emotion.

Yet detumescence is the end and climax of the whole drama; it is an anatomico-physiological process, certainly, but one that inevitably touches psychology at every point.[73] It is, indeed, the very key to the process of tumescence, and unless we understand and realize very precisely what it is that happens during detumescence, our psychological analysis of the sexual impulse must remain vague and inadequate.

From the point of view we now occupy, a man and a woman are no longer two highly sensitive organisms vibrating, voluptuously it may indeed be, but vaguely and indefinitely, to all kinds of influences and with fluctuating impulses capable of being directed into any channel,

even in the highest degree divergent from the proper ends of procreation. They are now two genital organisms who exist to propagate the race, and whatever else they may be, they must be adequately constituted to effect the act by which the future of the race is ensured. We have to consider what are the material conditions which ensure the most satisfactory and complete fulfillment of this act, and how those conditions may be correlated with other circumstances in the organism. In thus approaching the subject we shall find that we have not really abandoned the study of the psychic aspects of sex.

The two most primary sexual organs are the testis and the ovary; it is the object of conjugation to bring into contact the sperm from the testis with the germ from the ovary. There is no reason to suppose that the germ-cell and the sperm-cell are essentially different from each other. Sexual conjugation thus remains a process which is radically the same as the non-sexual mode of propagation which preceded it. The fusion of the nuclei of the two cells was regarded by Van Beneden, who in 1875 first accurately described it, as a process of conjugation comparable to that of the protozoa and the protophyta. Boveri, who has further extended our knowledge of the process, considers that the spermatozoon removes an inhibitory influence preventing the commencement of development in the ovum; the spermatozoon replaces a portion of the ovum which has already undergone degeneration, so that the object of conjugation is chiefly to

effect the union of the properties of two cells in one, sexual fertilization achieving a division of labor with reciprocal inhibition; the two cells have renounced their original faculty of separate development in order to attain a fusion of qualities and thus render possible that production of new forms and qualities which has involved the progress of the organized world.[74]

While in fishes this conjugation of the male and female elements is usually ensured by the female casting her spawn into an artificial nest outside the body, on to which the male sheds his milt, in all animals (and, to some extent, birds, who occupy an intermediate position) there is an organic nest, or incubation chamber as Bland Sutton terms it, the womb, in the female body, wherein the fertilized egg may develop to a high degree of maturity sheltered from those manifold risks of the external world which make it necessary for the spawn of fishes to be so enormous in amount. Since, however, men and women have descended from remote ancestors who, in the manner of aquatic creatures, exercised functions of sperm-extrusion and germ-extrusion that were exactly analogous in the two sexes, without any specialized female uterine organization, the early stages of human male and female foetal development still display the comparatively undifferentiated sexual organization of those remote ancestors, and during the first months of foetal life it is practically impossible to tell by the inspection of the genital regions whether the embryo would have developed into a man or into a woman.

If we examine the embryo at an early stage of development we see that the hind end is the body stalk, this stalk in later stages becoming part of the umbilical cord. The urogenital region, formed by the rapid extension of the hind end beyond its original limit, which corresponds to what is later the umbilicus, develops mainly by the gradual differentiation of structures (the Wolffian and Müllerian bodies) which originally exist identically in both sexes. This process of sexual differentiation is highly complex, so that it cannot yet be said that there is complete agreement among investigators as to its details. When some irregularity or arrest of development occurs in the process we have one or other of the numerous malformations which may affect this region. If the arrest occurs at a very early stage we may even find a condition of things which seems to approximate to that which normally exists in the adult reptilia.[75] Owing to the fact that both male and female organs develop from more primitive structures which were sexually undifferentiated, a fundamental analogy in the sexual organs of the sexes always remains; the developed organs of one sex exist as rudiments in the other sex; the testicles correspond to the ovaries; the female clitoris is the homologue of the male penis; the scrotum of one sex is the labia majora in the other sex, and so throughout, although it is not always possible at present to be quite certain in regard to these homologics.

Since the object to be attained by the sexual organs in the human species

is identical with that which they subserve in their pre-human ancestors, it is not surprising to find that these structures have a clear resemblance to the corresponding structures in the apes, although on the whole there would appear to be in man a higher degree of sexual differentiation. Thus the uterus of various species of _semnopithecus_ seems to show a noteworthy correspondence with the same organ in woman.[76] The somewhat less degree of sexual differentiation is well shown in the gorilla; in the male the external organs are in the passive state covered by the wrinkled skin of the abdomen, while in the female, on the contrary, they are very apparent, and in sexual excitement the large clitoris and nymphæ become markedly prominent. The penis of the gorilla, however, more nearly resembles that of man, according to Hartmann, than does that of the other anthropoid apes, which diverge from the human type in this respect more than do the cynocephalic apes and some species of baboon.

From the psychological point of view we are less interested in the internal sexual organs, which are most fundamentally concerned with the production and reception of the sexual elements, than with the more external parts of the genital apparatus which serve as the instruments of sexual excitation, and the channels for the intromission and passage of the seminal fluid. It is these only which can play any part at all in sexual selection; they are the only part of the sexual apparatus which can enter into the formation of either normal or abnormal

erotic conceptions;
they are the organs most prominently concerned with
detumescence; they
alone enter normally into the conscious process of sex
at any time. It
seems desirable, therefore, to discuss them briefly at
this point.

Our knowledge of the individual and racial
variations of the
external sexual organs is still extremely imperfect.
A few
monographs and collections of data on isolated
points may be
found in more or less inaccessible publications. As
regards
women, Ploss and Bartels have devoted a chapter to
the sexual
organs of women which extends to a hundred pages,
but remains
scanty and fragmentary. (*Das Weib*, vol. i, Chapter
VI.) The
most systematic series of observations have been
made in the case
of the various kinds of degenerates--idiots, the
insane,
criminals, etc.--but it would be obviously unsafe to
rely too
absolutely on such investigations for our knowledge
of the sexual
organs of the ordinary population.

There can be no doubt, however, that the external
sexual organs
in normal men and women exhibit a peculiarly wide
range of
variation. This is indicated not only by the
unsystematic results
attained by experienced observers, but also by more
systematic
studies. Thus Herman has shown by detailed
measurements that
there are great normal variations in the
conformation of the
parts that form the floor of the female pelvis. He

found that the projection of the pelvic floor varied from nothing to as much as two inches, and that in healthy women who had borne no children the distance between the coccyx and anus, the length of the perineum, the distance between the fourchette and the symphysis pubis, and the length of the vagina are subject to wide variations. (_Lancet_, October 12, 1889.) Even the female urethral opening varies very greatly, as has been shown by Bergh, who investigated it in nearly 700 women and reproduces the various shapes found; while most usually (in about a third of the cases observed), a longitudinal slit, it may be cross-shaped, star-shaped, crescentic, etc.; and while sometimes very small, in about 6 per cent. of the cases it admitted the tip of the little finger. (Bergh, _Monatsheft für Praktische Dermatologie_, 15 Sept., 1897.)

As regards both sexes, Stanley Hall states that "Dr. F.N.

Seerley, who has examined over 2000 normal young men as well as many young women, tells me that in his opinion individual variations in these parts are much greater even than those of face and form, and that the range of adult and apparently normal size and proportion, as well as function, and of both the age and order of development, not only of each of the several parts themselves, but of all their immediate annexes, and in females as

well as males, is far greater than has been recognized by any writer. This fact is the basis of the anxieties and fears of morphological abnormality so frequent during adolescence." (G.S. Hall, Adolescence, vol. i, p. 414).

In accordance with the supreme importance of the part they play, and the intimately psychic nature of that part, the sexual organs, both internal and external, are very richly supplied with nerves. While the internal organs are very abundantly furnished with sympathetic nerves and ganglia, the external organs show the highest possible degree of specialization of the various peripheral nervous devices which the organism has developed for receiving, accumulating, and transmitting stimuli to the brain.[77]

"The number of conducting cords which attach the genitals to the nervous centers is simply enormous," writes Bryan Robinson; "the pudic nerve is composed of nearly all the third sacral and branches from the second and fourth sacral. As one examines this nerve he is forced to the conclusion that it is an enormous supply for a small organ. The periphery of the pudic nerve spreads itself like a fan over the genitals." The lesser sciatic nerve supplies only one muscle--the gluteus maximus--and then sends the large pudendal branch to the side of the penis, and hence the friction of coitus induces active contraction of the gluteus maximus, "the main muscle of coition." The large pudic

and the pudendal constitute the main supply of the external genitals. In women the pudic nerve is equally large, but the pudendal much smaller, possibly, Bryan Robinson suggests, because women take a less active part in coitus. The nerve supply of the clitoris, however, is three or four times as large as that of the penis in proportion to size. (F.B. Robinson, "The Intimate Nervous Connection of the Genito-Urinary Organs With the Cerebro-Spinal and Sympathetic Systems," New York Medical Journal, March 11, 1893; id., The Abdominal Brain, 1899.)

Of all the sexual organs the penis is without doubt that which has most powerfully impressed the human imagination. It is the very emblem of generation, and everywhere men have contemplated it with a mixture of reverence and shuddering awe that has sometimes, even among civilized peoples, amounted to horror and disgust. Its image is worn as an amulet to ward off evil and invoked as a charm to call forth blessing. The sexual organs were once the most sacred object on which a man could place his hands to swear an inviolate oath, just as now he takes up the Testament. Even in the traditions of the great classic civilization which we inherit the penis is fascinus, the symbol of all fascination. In the history of human culture it has had far more than a merely human significance; it has been the symbol of all the generative force of Nature, the embodiment of creative energy in the animal and vegetable worlds alike, an image to be

held aloft for worship, the sign of all unconscious ecstasy. As a symbol, the sacred phallus, it has been woven in and out of all the highest and deepest human conceptions, so intimately that it is possible to see it everywhere, that it is possible to fail to see it anywhere.

In correspondence with the importance of the penis is the large number of names which men have everywhere bestowed upon it. In French literature many hundred synonyms may be found. They were also numerous in Latin. In English the literary terms for the penis seem to be comparatively few, but a large number of non-literary synonyms exist in colloquial and perhaps merely local usage. The Latin term penis, which has established itself among us as the most correct designation, is generally considered to be associated with _pendere_ and to be connected therefore with the usually pendent position of the organ. In the middle ages the general literary term throughout Europe was _coles_ (or _colis_) from _caulis_, a stalk, and _virga_, a rod. The only serious English literary term, yard (exactly equivalent to _virga_), as used by Chaucer--almost the last great English writer whose vocabulary was adequate to the central facts of life--has now fallen out of literary and even colloquial usage.

Pierer and Chaulant, in their anatomical and physiological _Real-Lexicon_ (vol. vi, p. 134), give nearly a hundred synonyms for the penis. Hyrtl (_Topographisches Anatomie_, seventh edition, vol. ii, pp. 67-69), adds others. Schurig, in his

Spermatologia (1720, pp. 89-91), also presents a number of names for the penis; in Chapter III (pp. 189-192) of the same book he discusses the penis generally with more fullness than most authors. Louis de Lande, in his *_Glossaire Erotique_* of the French language (pp. 239-242), enumerates several hundred literary synonyms for the penis, though many of them probably only occur once.

There is no thorough and comprehensive modern study of the penis on an anthropological basis (though I should mention a valuable and fully illustrated study of anthropological and pathological variations of the penis in a series of articles by Marandon de Montyel, "Des Anomalies des Organes Génitaux Externes Chez les Aliénées," etc., *_Archives d'Anthropologie Criminelle_*, 1895), and it would be out of place here to attempt to collect the scattered notices regarding racial and other variations. It may suffice to note some of the evidence showing that such variations seem to be numerous and important. The Arab penis (according to Kocher) is slender and long (a third longer than the average European penis) and with a club-shaped glans. It undergoes little change when it enters the erect state. The clothes leaves it quite free, and the Arab practices manual excitement at an early age to favor its development.

Among the Fuegians, also, according to Hyades and

Deniker (*Cap Horn*, vol. vii, p. 153), the average length of the penis is 77 millimeters, which is longer than in Europeans.

In men of black race, also, the penis is decidedly large. Thus Sir H.H. Johnston (*British Central Africa*, p. 399) states this to be a universal rule. Among the Wankenda of Northern Nyassa, for instance, he remarks that, while the body is of medium size, the penis is generally large. He gives the usual length as about six inches, reaching nine or ten in erection. The prepuce, it is added, is often very long, and circumcision is practiced by many tribes.

Among the American negroes Hrdlicka has found, also (*Proceedings American Association for the Advancement of Science*, vol. xlvii, p. 475), that the penis in black boys is larger than in white boys.

The passages cited above suggest the question whether the penis becomes larger by exercise of its generative functions. Most old authors assert that frequent erection makes the penis large and long (Schurig, *Spermatologia*, p. 107). Galen noted that in singers and athletes, who were chaste in order to preserve their strength, the sexual parts were small and rugose, like those of old men, and that exercise of the organs from youth develops them; Roubaud, quoting this observation (*Traité de l'Impuissance*, p. 373), agrees with the statement.

It seems

probable that there is an element of truth in this ancient belief. At the same time it must be remembered that the penis is only to small extent a muscular organ, and that the increase of size produced by frequent congestion of erectile tissues cannot be either rapid or pronounced. Variations in the size of the sexual organs are probably on the whole mainly inherited, though it is impossible to speak decisively on this point until more systematic observations become customary.

The scrotum has usually, in the human imagination, been regarded merely as an appendage of the penis, of secondary importance, although it is the garment of the primary and essential organs of sex, and the fact that it is not the seat of any voluptuous sensation has doubtless helped to confirm this position. Even the name is merely a mediæval perversion of _scortum_, skin or hide. In classic times it was usually called the pouch or purse. The importance of the testicles has not, however, been altogether ignored, as the very word _testis_ itself shows, for the _testis_ is simply the _witness_ of virility.[78]

It is easy to understand why the penis should occupy this special place in man's thoughts as the supreme sexual organ. It is the one conspicuous and prominent portion of the sexual apparatus, while its aptitude for swelling and erecting itself involuntarily, under the influence of sexual emotion, gives it a peculiar and almost unique position in the body. At the same

time it is the point at which, in the male body, all voluptuous sensation is concentrated, the only normal masculine center of sex.[79]

It is not easy to find any correspondingly conspicuous symbol of sex in the sexual region of women. In the normal position nothing is visible but the peculiarly human cushion of fat picturesquely termed the Mons Veneris (because, as Palfyn said, all those who enroll themselves under the banner of Venus must necessarily scale it), and even that is veiled from view in the adult by the more or less bushy plantation of hair which grows upon it. A triangle of varyingly precise definition is thus formed at the lower apex of the trunk, and this would sometimes appear to have been regarded as a feminine symbol.[80] But the more usual and typical symbol of femininity is the idealized ring (by some savages drawn as a lozenge) of the vulvar opening--the yoni corresponding to the masculine lingam--which is normally closed from view by the larger lips arising from beneath the shadow of the mons. It is a symbol that, like the masculine phallus, has a double meaning among primitive peoples and is sometimes used to call down a blessing and sometimes to invoke a curse.[81]

This external opening of the feminine genital passage with its two enclosing lips is now generally called the vulva. It would appear that originally (as by Celsus and Pliny) this term included the womb, also, but when the term "uterus" came into use "vulva" was confined (as its sense of

folding doors suggests that it should be) to the external entrance. The classic term cunnus for the external genitals was chiefly used by the poets; it has been the etymological source of various European names for this region, such as the old French con, which has now, however, disappeared from literature while even in popular usage it has given place to lapin and similar terms. But there is always a tendency, marked in most parts of the world, for the names of the external female parts to become indecorous. Even in classic antiquity this part was the pudendum, the part to be ashamed of, and among ourselves the mass of the population, still preserving the traditions of primitive times, continue to cherish the same notion.

The anatomy, anthropology, folk-lore, and terminology of the external and to some extent the internal feminine sexual region may be studied in the following publications, among others:

Ploss, Das Weib, vol. i, Chapter VI; Hyrtl, Topographisches Anatomie, vol. ii, and other publications by the same scholarly anatomist; W.J. Stewart Mackay, History of Ancient Gynæcology, especially pp. 244-250; R. Bergh, "Symbolæ ad Cognitionem Genitalium Externorum Foeminearum" (in Danish), Hospitalstidende, August, 1894; and also in Monatshefte für Praktische Dermatologie, 1897. D.S. Lamb, "The Female External Genital Organs," New York Journal of Gynæcology, August, 1894; R.L. Dickinson, "Hypertrophies of the Labia Minora and Their

Significance," *American Gynecology*, September, 1902; *Kryptadia* (in various languages), vol. viii, pp. 3-11, 11-13, and many other passages. Several of Schurig's works (especially *Gynæcologia*, *Muliebria*, and *Parthenologia*) contain full summaries of the statements of the early writers.

The external or larger lips, like the *mons veneris*, are specifically human in their full development, for in the anthropoid apes they are small as is the *mons*, and in the lower apes absent altogether; they are, moreover, larger in the white than in the other human races. Thus in the negro, and to a less degree in the Japanese (Wernich) and the Javanese (Scherzer) they are less developed than in women of white race. The greater lips develop in the foetus later than the lesser lips, which are thus at first uncovered; this condition thus constitutes an infantile state which occasionally (in less than 2 per cent. of cases, according to Bergh) persists in the adult. Their generally accepted name, *labia majora*, is comparatively modern.[82]

The outer sides of the *labia majora* are covered with hair, and on the inner sides, which are smooth and moist, but are not true mucous membrane, there are a few sweat glands and numerous large sebaceous glands. Bergh considers that there is little or no hair on the inner sides of the *labia majora*, but Lamb states that careful examination shows that from one- to two-thirds of the inner surface in adult women show hairs like those

of the

external surface. In brunettes and women of dark races this

surface is pigmented; in dark races it is usually a slate gray.

From an examination of 2200 young Danish prostitutes Bergh has

found that there are two main varieties in the shape of the labia

majora, with transitional forms. In the first and most frequent

form the labia tend to be less marked and more effaced and

separated at the upper and anterior part, often being lost in the

sides of the mons and presenting a fissure which is broader in

its upper part and showing the inner lips more or less bare. In

the second form the labia are thicker and more outstanding and

the inner edges lie in contact throughout their whole length,

showing the _rima pudendi_ as a long narrow fissure.

Whatever the

form, the labia close more tightly together in virgins and in

young individuals generally than in the deflowered and the

elderly. In children, as Martineau pointed out, the vulva appears

to look directly forward and the clitoris and urinary meatus

easily appear, while in adult women, and especially after

attempts at coitus have been made, the vulva appears directed

more below and behind, and the clitoris and meatus more covered

by the labia majora; so that the child urinates forward, while

the adult woman is usually able to urinate almost directly

downwards in the erect position, though in some cases (as may

occasionally be observed in the street) she can only do so when bending slightly forwards. This difference in the direction of the stream formerly furnished one of the methods of diagnosing virginity, an uncertain one, since the difference is largely due to age and individual variation. The main factor in the position and aspect of the vulva is pelvic inclination. (See Havelock Ellis, *Man and Woman*, fourth edition, p. 64; Stratz, *Die Schönheit des Weiblichen Körpers*, Chapter XII.) In the European woman, according to Stratz, a considerable degree of pelvic inclination is essential to beauty, concealing all but the anterior third of the vulva. In negresses and other women of lower race the vulva, however, usually lies further back, being more conspicuous from behind than in European women; in this respect lower races resemble the apes. Those women of dark race, therefore, whose modesty is focused behind rather than in front thus have sound anatomical considerations on their side.

As Ploss and Bartels remark, a very common variation among European women consists in an unusually posterior position of the vulva and vaginal entrance, so that unless a cushion is placed under the buttocks it is difficult for the man to effect coitus in the usual position without giving much pain to the woman. They add that another anomaly, less easy to remedy, consists in an

abnormally anterior position of the vaginal entrance
close
beneath the pelvic bone, so that, although
intromission is easy,
the spasmodic contraction of the vagina at the
culmination of
orgasm presses the penis against the bone and causes
intolerable
pain to the man.

The mons veneris and the labia majora are, after the age
of puberty,
always normally covered by a more or less profuse growth
of hair. It is
notable that the apes, notwithstanding their general
tendency to
hairiness, show no such special development of hair in
this region. We
thus see that all the external and more conspicuous
portions of the sexual
sphere in woman--the mons veneris, the labia majora, and
the
hair--represent not so much an animal inheritance, such
as we commonly
misrepresent them to be, but a higher and genuinely
human development. As
none of these structures subserve any clear practical
use, it would appear
that they must have developed by sexual selection to
satisfy the æsthetic
demands of the eye.[83]

The character and arrangement of the pubic hair,
investigated by
Eschricht and Voigt more than half a century ago,
have been more
recently studied by Bergh. As these observers have
pointed out,
there are various converging hair streams from above
and below,
the clitoris seeming to be the center towards which
they are
directed. The hair-covering thus formed is usually
ample and, as
a rule, is more so in brunettes than in blondes. It

is nearly
always bent, curly and more or less spirally
twisted.[84] There
are frequently one or two curls at the commencement
of the
fissure, rolled outwards, and occasionally a well
marked tuft in
the middle line. In abundance the pubic hair
corresponds with the
axillary hair; when one region is defective in hair
the other is
usually so also. Strong eyebrows also usually
indicate a strong
development of pubic hair. But the hair of the head
usually
varies independently, and Bergh found that of 154
women with
sparse pubic hair 72 had good and often profuse hair
on the head.
Complete or almost complete absence of pubic hair is
in Bergh's
experience only found in about 3 per cent. of women;
these were
all young and blonde.

Rothe, in his investigation of the pubic hair of 1000
Berlin women, found
that no two women were really alike in this respect, but
there was a
tendency to two main types of arrangement, with minor
subdivisions,
according as the hair tended to grow chiefly in the
middle line extending
laterally from that line, or to grow equally over the
whole extent of the
pubic region; these two groups included half the cases
investigated.

In men the pubic hair normally ascends anteriorly in
a faint line
up to the navel, with tendency to form a triangle
with the apex
above, and posteriorly extends backwards to the
anus. In women
these anterior and posterior extensions are

comparatively rare,

or at all events are only represented by a few stray hairs. Rothe

found this variation in 4 per cent. of North German women, though

a triangle of hair was only found in 2 per cent.; Lombroso found

it in 5 per cent, of Italian women; Bergh found it in only 1.6

per cent. among 1000 Danish prostitutes, all sixteen of whom with

three exceptions were brunettes. In Vienna, among 600 women, Coe

found only 1 per cent, with this distribution of hair, and states

that they were women of decidedly masculine type, though Ploss

and Bartels, as well as Rothe, find, however, that heterogeny, as

they term the masculine distribution, is more common in blondes.

The anterior extension of hair is usually accompanied by the

posterior extension around the anus, usually very slight, but

occasionally as pronounce as in men. (According to Rothe,

however, anterior heterogeny comparatively rare.) These masculine

variations in the extension of the pubic hair appear to be not

uncommonly associated with other physical and psychic anomalies;

it is on this account that they have sometimes been regarded as

indications of a vicious or a criminal temperament; they are,

however, found in quite normal women.

The pubic hair of women is usually shorter than that of men, but

thick, and the individual hairs stronger and larger in diameter

than those of men, as Pfaff first showed; dark hair is usually

stronger than light. In both length and size the individual variations are considerable. The usual length is about 2 inches, or 3-5 centimeters, occasionally reaching about 4 inches, or 9-10 centimeters, in the larger curls. In a series of 100 women attended during confinement in London and the north of England I have only once (in a rather blonde Lancashire woman) found the hair on labia reaching a conspicuous length of several inches and forming an obstruction to the manipulations involved in delivery. But Jahn delivered a woman whose pubic hair was longer than that of her head, reaching below her knee; Paulini also knew a woman whose pubic hair nearly reached her knees and was sold to make wigs; Bartholin mentions a soldier's wife who plaited her pubic hair behind her back; while Brantôme has several references to abnormally long hair in ladies of the French court during the sixteenth century. In 8 cases out of 2200 Bergh found the pubic hair forming a large curly wig extending to the iliac spines. The individual hairs have occasionally been found so stiff and brush-like as to render coitus difficult.

In color the pubic hair, while generally approximating to that of the head, is sometimes (according to Rothe, in Germany, in one-third cases) lighter, and sometimes somewhat darker, as is found to be the case by Coe, especially in brunettes, and also by Bergh, in Denmark. Bergh remarks that it is

generally

intermediate in color between the eyebrows and the axillary hair, the latter being more or less decolorized by sweat, and that, owing to the influence of the urine and vaginal discharges, the labial hair is paler than that on the mons; blondes with dark eyebrows usually have dark hair on the mons. The hair on this spot, as Aristotle observed, is usually the last to turn gray.

The key to the genital apparatus in women from the psychic point of view, and, indeed, to some extent, its anatomical center, is to be found in the clitoris. Anatomically and developmentally the clitoris is the rudimentary analogue of the masculine penis. Functionally, however, its scope is very much smaller. While the penis both receives and imparts specific voluptuous sensations, and is at the same time both the intromittent organ for the semen and the conduit for the urine, the sole function of the clitoris is to enter into erection under the stress of sexual emotion and receive and transmit the stimulatory voluptuous sensations imparted to it by friction with the masculine genital apparatus. It is so insignificant an organ that it is only within recent times that its homology with the penis has been realized. In 1844 Kobelt wrote in his important book, *Die Mannlichen und Weiblichen Wollust-Organen*, that in his attempt to show that the female organs are exactly analogous to the male the reader will probably be unable to follow him, while even Johannes Müller, the father of scientific physiology, declared at about the same

period that the clitoris is essentially different from the penis. It is indeed but three centuries since the clitoris was so little known that (in 1593) Realdus Columbus actually claimed the honor of discovering it. Columbus was not its discoverer, for Fallopius speedily showed that Avicenna and Albucasis had referred to it.[85] The Arabs appear to have been very familiar with it, and, from the various names they gave it, clearly understood the important part it plays in generating voluptuous emotion.[86] But it was known in classic antiquity; the Greeks called it myrton, the myrtle-berry; Galen and Soranus called it nymphê because it is covered as a bride is veiled, while the old Latin name was tentigo, from its power of entering into erection, and columella, the little pillar, from its shape. The modern term, which is Greek and refers to the sensitiveness of the part to voluptuous titillation, is said to have originated with Suidas and Pollux.[87] It was mentioned, though not adopted, by Rufus.

"The clitoris," declared Haller, "is a part extremely sensible and wonderfully prurient." It is certainly the chief though by no means the only point through which the immediate call to detumescence is conveyed to the female organism. It is, indeed, as Bryan Robinson remarks, "a veritable electrical bell button which, being pressed or irritated, rings up the whole nervous system."

The nervous supply of this little organ is very large, and the dorsal nerve of the clitoris is relatively three or

four times

larger than that of the penis. Yet the sensitive point of this

organ is only 5 to 7 millimeters in extent. The length of the

clitoris is usually rather over 2 centimeters (or about an inch)

and 3 centimeters when erect; a length of 4 centimeters or more

was regarded by Martineau as within the normal range of

variation. It is not usual to find the clitoris longer than this

in Europe (for among some races like the negro the clitoris is

generally large), but all degrees of magnitude may be found as

rare exceptions. (See, e.g., Sir J.Y. Simpson, "Hermaphrodites,"

Obstetric Memoirs and Contributions, vol. ii, pp. 217-226; also

Dickinson, loc. cit.) It was formerly thought that the clitoris

is easily enlarged by masturbation, and Martineau believed that

in this way it might be doubled in length. It is probable that

slight enlargement of the clitoris may be caused by very

frequent masturbation, but only to an insignificant extent, and

it is impossible to diagnose masturbation from the size of the

clitoris. Among the women of Lake Nyassa, as well as in the

Caroline Islands, special methods are practiced for elongating

the clitoris, but in Europe, at all events, it is probable that

the variations in the size of the organ are mainly congenital. It

may well be that a congenitally large clitoris is associated with

an abnormally developed excitability of the sexual apparatus.

Tilt stated (*_On Uterine and Ovarian Inflammation_*, p. 37) that in his experience there was a frequent though not invariable connection between a large clitoris and sexual proclivity. (Schurig referred to a case of intense and life-long sexual obsession associated with an extremely large clitoris, *_Gynæcologia_*, pp. 16-17.) Of recent years considerable importance has been attached by some gynecologists (e.g., R.T. Morris, "Is Evolution Trying to Do Away With the Clitoris?" *_Transactions American Association of Obstetricians and Gynecologists_*, vol. v, 1893) to preputial adhesions around the clitoris as a source of nervous disturbance and invalidism in young women.

While the clitoris is anatomically analogous to the penis, its actual mechanism under the stress of sexual excitement is somewhat different. As Liétaud long since pointed out, it cannot rise freely in erection as the penis can; it is apparently bound down by its prepuce and its frenulum. Waldeyer, in his book on the pelvis, states more precisely that, unlike the penis, when erect it retains its angle, only this becomes somewhat rounded so that the organ is to some slight extent lifted and protruded. Waldeyer considered that the clitoris was thus perfectly fitted to fulfill its part as the recipient of erotic stimulation from friction by the penis. Adler, however, has pointed out with considerable justice, that this is not altogether the case. The clitoris was

developed in mammals who practiced the posterior mode of coitus; in this position the clitoris was beneath the penis, which was thus easily able in coitus to press it against the pubic bone close beneath which it is situated, and thus impart the compression and friction which the feminine organ craves. But in the human anterior mode of coitus it is not necessarily brought into close contact with the penis during the act of coitus, and thus fails to receive powerful stimulation. Its restricted position, which is an advantage in posterior coitus, is a disadvantage in anterior coitus. Adler observes that it thus comes about that the human method of coitus, while by bringing breast to breast and face to face it has added a new dignity and refinement, a fresh source of enjoyment, to the embrace of the sexes, has not been an unmixed advantage to woman, for while man has lost nothing by the change, woman has now to contend with an increased difficulty in attaining an adequate amount of pressure on that "electric button" which normally sets the whole mechanism in operation.[88]

We may well bring into connection with the changed conditions brought about by anterior coitus the interesting fact that while the clitoris remains the most exquisitely sensitive of the sexual centers in woman, voluptuous sensitivity is much more widely diffused in woman than in man. Over the whole body, indeed, it is apt to be more distinctly marked than is usually the case in man. But even if we confine ourselves to the genital region, while in man that portion of the penis which enters the

vagina, and especially the glans, is normally the only portion which, even during turgescence, is sensitive to voluptuous contacts, in woman the whole of the region comprised within the larger lips, including even the anus and internally the vagina and the vaginal portion of the womb,[89] become sensitive to voluptuous contacts. Deprived of the penis the ability of a man to experience specifically sexual sensations becomes very limited indeed. But the loss of the clitoris or of any other structure involves no correspondingly serious disability on women. Ablation of the clitoris for sexual hyperæsthesia has for this reason been abandoned, except under special circumstances. The members of the Russian Skoptzy sect habitually amputate the clitoris, nymphæ, and breasts, yet many young Skoptzy women told the Russian physician, Guttceit, that they were perfectly well able to enjoy coitus.

Freud believes that in very young girls the clitoris is the exclusive seat of sexual sensation, masturbation at this age being directed to the clitoris alone, and spontaneous sexual excitement being confined to twitchings and erection of this organ, so that young girls are able, from their own experience, to recognize without instruction the signs of sexual excitement in boys. At a later age sexual excitability spreads from the clitoris to other regions--just as the easy inflammability of wood sets light to coal--though in the male the penis remains from first to last normally the almost exclusive

seat of specific
excitability. (S. Freud, Drei Abhandlungen zur
Sexualtheorie,
p. 62.)

The anus would, however, seem to be sometimes an
erogenous zone
even at an early age. Titillation of the anus
appears to be
frequently pleasurable in women; and this is not
surprising
considering the high degree of erotic sensitivity
which is easily
developed at the body orifices where skin meets
mucous membrane.
(Thus the meatus of the urethra is a highly
erogenous zone, as is
sufficiently shown by the frequency with which hair-
pins and
other articles used in masturbation find their way
into the
bladder.) It is in this germinal sensitivity,
undoubtedly, that
we find a chief key to the practice of pedicatio.
Freud
attaches great importance to the anus as a sexually
erogenous
zone at a very early age, and considers that it very
frequently
makes its influence felt in this respect. He
believes that
intestinal catarrhs in very early life and
hæmorrhoids later tend
to develop sensibility in the anus. He finds an
indication that
the anus has become a sexually erogenous zone when
children wish
to allow the contents of the rectum to accumulate so
that
defecation may by its increased difficulty involve
voluptuous
sensations, and adds that masturbatory excitation of
the anus
with the fingers is by no means rare in older
children. (S.

Freud, *Op. cit.*, pp. 40-42.) A medical correspondent in India tells me of a European lady who derived, she said, "quite as much, indeed more," pleasure from digitally titillating her rectum as from vulvo-vaginal titillation; she had several times submitted to *_pedicatio_* and enjoyed it, though it was painful during penetration. The anus may retain this erogenous irritability even in old age, and Routh mentions the case of a lady of over 70, the reverse of lustful, who was so excited by the act of defecation that she was invariably compelled to masturbate, although this state of things was a source of great mental misery to her. (C.H.F. Routh, *_British Gynæcological Journal_*, February, 1887, p. 48.)

Bölsche has sought the explanation of the erogenous nature of the anus, and the key to *_pedicatio_*, in an atavistic return to the very remote amphibian days when the anus was combined with the sexual parts in a common cloaca. But it is unnecessary to invoke any vestigial inheritance from a vastly remote past when we bear in mind that the innervation of these two adjoining regions is inevitably very closely related. The presence of a body exit with its marked and special sensitivity at a point where it can scarcely fail to receive the nervous overflow from an immensely active center of nervous energy quite adequately accounts for the phenomenon in question.

The inner lips, the nymphæ or labia minora, running parallel with the greater lips which enclose them, embrace the clitoris anteriorly and extend backward, enclosing the urethral exit between them as well as the vaginal entrance. They form little wings whence their old Latin name, *_alæ_*, and from their resemblance to the cock's comb were by Spigelius termed *crista galli*. The red and (especially in brunettes) dark appearance of the nymphæ suggests that they are mucous membrane and not integumentary; it is, however, now considered that even on the inner surface they are covered by skin and separated from the mucous membrane by a line.[90] In structure, as described by Waldeyer, they consist of fine connective tissue rich in elastic fibers as well as some muscular tissue, and full of large veins, so that they are capable of a considerable degree of turgescence resembling erection during sexual excitement, while Ballantyne finds that the nymphæ are supplied to a notable extent with nervous end-organs.

More than any other part of the sexual apparatus in either sex, the lesser lips, on account of their shape, their position, and their structure, are capable of acquired modifications, more especially hypertrophy and elongation. By stretching, it is stated, a labium can be doubled in its dimensions. The "Hottentot apron," or elongated nymphæ, commonly found among some peoples in South Africa, has long been a familiar phenomenon. In such cases a length or transverse diameter of 3 to 5 centimeters is

commonly found. But such elongated nymphæ are by no means confined to one part of the world or to one race; they are quite common among women of European race, and reach a size equal to most of the more reliably recorded Hottentot cases. Dickinson, who has very carefully studied this question in New York, finds that in 1000 consecutive gynæcological cases the labia showed some form of hypertrophy in 36 per cent., or more than 1 in 3; while among 150 of these cases who were neurasthenic, the proportion reached 56 per cent., even when minor or doubtful enlargements were disregarded. Bergh, in about 16 per cent. cases, found very enlarged nymphæ, the height reached in about 5 per cent. of the cases of enlargement being nearly six centimeters. Ploss and Bartels, in a full discussion: of the "Hottentot apron," come to the conclusion that this condition is perhaps in most cases artificially produced. It is known that among the Basutos it is the custom for the elder girls to manipulate the nymphæ of younger children, when alone with them, almost from birth, and on account of the elastic nature of these structures such manipulation quite adequately accounts for the elongation. It is not necessary to suppose that the custom is practiced for the sake of producing sexual stimulation--though this may frequently occur--since there are numerous similar primitive customs involving deformation of the sexual organs without the production of sexual excitement. Dickinson has come to a similar conclusion as regards the corresponding elongation of the nymphæ in civilized European women. In 361 out of 1000 women of

good social class
he found elongation or thickening, often with a notable degree of wrinkling and pigmentation, and believes that this is always the result of frequently repeated masturbation practiced with the separation of the nymphæ; in 30 per cent. of the cases admission of masturbation was made.[91] While this conclusion is probably correct in the main, it requires some qualification. To assert that whenever in women who have not been pregnant the marked protrusion of the inner lips beyond the outer lips means that at some period manipulation has been practiced with or without the production of sexual excitement is to make too absolute a statement. It is highly probable that the nymphæ, like the clitoris, are congenitally more prominent in some of the lower human races, as they are also in the apes; among the Fuegians, for instance, according to Hyades and Deniker, the labia minora descend lower than in Europeans, although there is not the slightest reason to suppose that these women practice any manipulations. Among European women, again, the nymphæ sometimes protrude very prominently beyond the labia majora in women who are organically of somewhat infantile type; this occurs in cases in which we may be convinced that no manipulations have ever been practiced.[92]

It is difficult to speak very decisively as to the function of the labia minora. They doubtless exert some amount of protective influence over the entrance to the vagina, and in this way correspond to the lips of the mouth after which they are called. They fulfill, however, one very

definite though not obviously important function which is indicated by the mythologic name they have received. There is, indeed, some obscurity in the origin of this term, nymphæ, which has not, I believe, been satisfactorily cleared up. It has been stated that the Greek name nymphê has been transferred from the clitoris to the labia minora. Any such transfer could only have taken place when the meaning of the word had been forgotten, and nymphê had become the totally different word nymphæ, the goddesses who presided over streams. The old anatomists were much exercised in their minds as to the meaning of the name, but on the whole were inclined to believe that it referred to the action of the labia minora in directing the urinary stream. The term nymphæ was first applied in the modern sense, according to Bergh, in 1599, by Pinæus, mainly from the influence of these structures on the urinary stream, and he dilated in his De Virginitate on the suitability of the term to designate so poetic a spot.[93] In more modern times Luschka and Sir Charles Bell considered that it is one of the uses of the nymphæ to direct the stream of urine, and Lamb from his own observation thinks the same conclusion probable. In reality there cannot be the slightest doubt about the function of the nymphæ, as, in Hyrtl's phrase, "the naiads of the urinary source," and it can be demonstrated by the simplest experiment.[94]

The nymphæ form the intermediate portal of the vagina, as the canal which conducts to the womb was in anatomy first termed (according to Hyrtl) by De Graaf.[95] It is a secreting, erectile, more or less

sensitive canal
lined by what is usually considered mucous membrane,
though some have
regarded it as integument of the same character as that
of the external
genitals; it certainly resembles such integument more
than, for instance,
the mucous membrane of the rectum. In the woman who has
never had sexual
intercourse and has been subjected to no manipulations
or accidents
affecting this region, the vagina is closed by a last
and final gate of
delicate membrane--scarcely admitting more than a
slender finger--called
the hymen.

The poets called the hymen "flos virginittatis," the
flower of
virginity, whence the medico-legal term
defloratio.

Notwithstanding the great significance which has
long been
attached to the phenomena connected with it, the
hymen was not
accurately known until Vesalius, Fallopius, and
Spigelius
described and named it. It was, however, recognized
by the Arab
authors, Avicenna and Averroes. The early literature
concerning
it is summarized by Schurig, Muliebria, 1729,
Section II, cap.

V. The same author's Parthenologia is devoted to
the various
ancient problems connected with the question of
virginity.

To say that this delicate piece of membrane is from the
non-physical point
of view a more important structure than any other part
of the body is to
convey but a feeble idea of the immense importance of
the hymen in the
eyes of the men of many past ages and even of our own

times and among our
own people.[96] For the uses of the feminine body, or
for its beauty,
there is no part which is more absolutely insignificant.
But in human
estimation it has acquired a spiritual value which has
made it far more
than a part of the body. It has taken the place of the
soul, that whose
presence gives all her worth and dignity, even her name,
to the unmarried
woman, her purity, her sexual desirability, her market
value. Without
it--though in all physical and mental respects she might
remain the same
person--she has sometimes been a mark for contempt, a
worthless
outcast.[97]

So fragile a membrane scarcely possesses the
reliability which
should be possessed by a structure whose presence or
absence has
often meant so much. Its absence by no means
necessarily
signifies that a woman has had intercourse with a
man. Its
presence by no means signifies that she has never
had such
intercourse.

There are many ways in which the hymen may be
destroyed apart
from coitus. Among the Chinese (and also, it would
appear, in
India and some other parts of the East) the female
parts are from
infancy kept so scrupulously clean by daily washing,
the finger
being introduced into the vagina, that the hymen
rapidly
disappears, and its existence is unknown even to
Chinese doctors.

Among some Brazilian Indians a similar practice
exists among

mothers as regards their young children, less, however, for the sake of cleanliness than in order to facilitate sexual intercourse in future years. (Ploss and Bartels, *Das Weib*, vol. i, Chapter VI.) The manipulations of vaginal masturbation will, of course, similarly destroy the hymen. It is also quite possible for the hymen to be ruptured by falls and other accidents. (See, e.g., a lengthy study by Nina-Rodrigues, "Des Ruptures de l'Hymen dans les Chutes," *Annales d'Hygiène Publique*, September, 1903.)

On the other hand, integrity of the hymen is no proof of virginity, apart from the obvious fact that there may be intercourse without penetration. (The case has even been recorded of a prostitute with syphilitic condylomata, a somewhat masculine type of pubic arch, and vulva rather posteriorly placed, whose hymen had never been penetrated.) The hymen may be of a yielding or folding type, so that complete penetration may take place and yet the hymen be afterwards found unruptured. It occasionally happens that the hymen is found intact at the end of pregnancy. In some, though not all, of these cases there has been conception without intromission of the penis. This has occurred even when the entrance was very minute. The possibility of such conception has long been recognized, and Schurig (*Syllepsilogia*, 1731, Section I, cap. VIII, p. 2) quotes ancient authors who have

recorded cases. For some typical modern cases see Guérard (*Centralblatt für Gynäkologie*, No. 15, 1895), in one of whose cases the hymen of the pregnant woman scarcely admitted a hair; also Braun (*ib.*, No. 23, 1895).

The hymen has played a very definite and pronounced part in the social and moral life of humanity. Until recently it has been more difficult to decide what precise biological function it has exercised to ensure its development and preservation. Sexual selection, no doubt, has worked in its favor, but that influence has been very limited and comparatively very recent. Virginity is not usually of any value among peoples who are entirely primitive. Indeed, even in the classic civilization which we inherit, it is easy to show that the virgin and the admiration for virginity are of late growth; the virgin goddesses were not originally virgins in our modern sense. Diana was the many-breasted patroness of childbirth before she became the chaste and solitary huntress, for the earliest distinction would appear to have been simply between the woman who was attached to a man and the woman who followed an earlier rule of freedom and independence; it was a later notion to suppose that the latter woman was debarred from sexual intercourse. We certainly must not seek the origin of the hymen in sexual selection; we must find it in natural selection. And here it might seem at first sight that we come upon a contradiction in Nature, for Nature is always devising contrivances to secure the maximum amount of fertilization. "Increase

and multiply" is so obviously the command of Nature that the Hebrews, with their usual insight, unhesitatingly dared to place it in the mouth of Jehovah. But the hymen is a barrier to fertilization. It has, however, always to be remembered that as we rise in the zoölogical scale, and as the period of gestation lengthens and the possible number of offspring is fewer, it becomes constantly more essential that fertilization shall be effective rather than easy; the fewer the progeny the more necessary it is that they shall be vigorous enough to survive. There can be little doubt that, as one or two writers have already suggested, the hymen owes its development to the fact that its influence is on the side of effective fertilization. It is an obstacle to the impregnation of the young female by immature, aged, or feeble males. The hymen is thus an anatomical expression of that admiration of force which marks the female in her choice of a mate. So regarded, it is an interesting example of the intimate manner in which sexual selection is really based on natural selection. Sexual selection is but the translation into psychic terms of a process which has already found expression in the physical texture of the body.

It may be added that this interpretation of the biological function of the hymen is supported by the facts of its evolution. It is unknown among the lower mammals, with whom fertilization is easy, gestation short and offspring numerous. It only begins to appear among the higher mammals in whom reproduction is already

beginning to take on the characters which become fully developed in man. Various authors have found traces of a rudimentary hymen, not only in apes, but in elephants, horses, donkeys, bitches, bears, pigs, hyenas, and giraffes. (Hyrtl, Op. cit., vol. ii, p. 189; G. Gellhoen, "Anatomy and Development of the Hymen," American Journal Obstetrics, August, 1904.) It is in the human species that the tendency to limitation of offspring is most marked, combined at the same time with a greater aptitude for impregnation than exists among any lower mammals. It is here, therefore, that a physical check is of most value, and accordingly we find that in woman alone, of all animals, is the hymen fully developed.

FOOTNOTES:

[72] "Analysis of the Sexual Impulse," in vol. iii of these Studies.

[73] "The accomplishment of no other function," Hyrtl remarks, "is so intimately connected with the mind and yet so independent of it."

[74] The process is still, however, but imperfectly understood; see Art.

"Fécondation," by Ed. Retterer, in Richet's Dictionnaire de Physiologie, vol. vi, 1905.

[75] Thus a male foetus showing reptilian characters in sexual ducts was exhibited by Shattock at the Pathological Society of London, February 19,

1895.

[76] J. Kohlbrugge, "Die Umgestaltung des Uterus der Affen nach den Geburt," *Zeitschrift für Morphologie*, bd. iv, p. 1, 1901.

[77] There are, however, no special nerve endings (Krause corpuscles), as was formerly supposed. The nerve endings in the genital region are the same as elsewhere. The difference lies in the abundance of superposed arboreal ramifications. See, e.g., Ed. Retterer, Art. "Ejaculation," Richet's *Dictionnaire de Physiologie*, vol. v.

[78] Hyrtl, *Op. cit.*, vol. ii, p. 39.

[79] Sensations of pleasure without those of touch appear to be normal at the tip of the penis, as pointed out by Scripture, quoted in *Alienist and Neurologist*, January, 1898.

[80] See the previous volume of these *Studies*, "Sexual Selection in Man," p. 161.

[81] See, e.g., Ploss and Bartels, *Das Weib*, vol. i, beginning of chapter VI.

[82] Hyrtl states that the name *labia* was first used by Haller in the middle of the eighteenth century in his *Elements of Physiology*, being adopted by him from the Greek poet Erotion, who gave these structures the very obvious name *cheilea*, lips. But this seems to be a mistake, for the seventeenth century anatomists certainly used the name "labia" for these parts.

[83] Bergh tentatively suggests, as regards the pubic hair, that its appearance may be due to the upright walk in man and the human position during coitus, the hair preventing irritation of the genitals from the sweat pouring down from the body and protecting the skin from direct friction in coitus. (In both these suggestions he was, however, long previously anticipated by Fabricius ab Aquapendente.) The fanciful suggestion of Louis Robinson that the pubic hair has developed in order to enable the human infant to cling securely to his mother is very poorly supported by facts, and has not met with acceptance. It may be mentioned that (as stated by Ploss and Bartels) the women of the Bismarck Archipelago, whose pubic hair is very abundant, use it as a kind of handkerchief on which to clean their hands.

[84] Routh and Heywood Smith have noted that the pubic hair tends to lose its curliness and become straight in women who masturbate. (British Gynæcological Journal, February, 1887, p. 505.)

[85] Schurig, Muliebria, p. 75. Plazzon in 1621 said that in Italian it had a popular name, il besneegio.

[86] Schurig brought together in his Gynæcologia (pp. 2-4) various early opinions concerning the clitoris as the seat of voluptuous feeling.

[87] Hyrtl, Op. cit., vol. ii, p. 193.

[88] Adler, Die Mangelhafte Geschlechtsempfindung des Weibes, 1904, pp. 117-119.

[89] The voluptuous sensations caused by sexual contacts producing movements of the womb are probably normal and usual. They may even occur under circumstances unconnected with sexual emotion, and Mundé (*International Journal of Surgery*, March, 1893) mentions incidentally that in one case while titillating the cervix with a sound the woman very plainly showed voluptuous manifestations.

[90] Henle stated that fine hairs are frequently visible on the nymphæ; Stieda (*Zeitschrift für Morphologie*, 1902, p. 458) remarks that he has never been able to see them with the naked eye.

[91] R.L. Dickinson, "Hypertrophies of the Labia Minora and Their Significance," *American Gynæcologist*, September, 1902. It is perhaps noteworthy that Bergh found that in 302 cases in which the nymphæ were of unequal length, in all but 24 the left was longer.

[92] It may be remarked that Bergh believes that the nymphæ, and indeed the external genitals generally, are congenitally more strongly developed in libidinous persons, and at the same time in brunettes, while in public prostitutes this is not usually the case, which confirms the belief that exalted sexual sensibility does not usually lead to prostitution. He adds that prostitution, unless carried on for many years, has little effect on the shape of the external genitals.

[93] Schurig (*Muliebria*, 1729, Section II, cap. II) gives numerous quotations on this point; thus De Graaf wrote in his book on the sexual organs of women: "Tales protuberantiæ nymphæ appellantur

ea propter quod
aquis e vesica prosilientibus proxime adstare
reperiantur, quandoquidem
inter illas, tanquam duos parietes, urina magno impetu
cum sibilo sæpe et
absque labiorum irrigatione erumpit, vel quod sint
castitatis præsides,
aut sponsam primo intromittant."

[94] Havelock Ellis, "The Bladder as a Dynamometer,"
_American Journal of
Dermatology_, May, 1902. If a woman who has never been
pregnant, standing
in the erect position before commencing the act of
urination presses apart
the labia minora with index and middle fingers the
stream will be
projected forward so as to fall usually at a
considerable distance in
front of a vertical line from the meatus; if when the
act is half
completed the fingers are removed, the labia close
together and the
stream, though maintained at a constant pressure, at
once changes its
character and direction.

[95] In poetry this term was employed by Plautus,
Pseudolus, Act IV, Sc.
7. The Greek *aidoion* sometimes meant vagina and
sometimes the external
sexual parts; *kolpos* was used for the vagina alone.

[96] It is curious, however, that the European
physicians of the
seventeenth and even eighteenth centuries were doubtful
of its value as a
sign of virginity and considered it often absent.

[97] For a summary of the beliefs and practices of
various peoples with
regard to the hymen and virginity see Ploss and Bartels,
Das Weib, vol.
i, Chapter XVI.

The Occasional
Serious Effects of Coitus.

We have seen what the object of detumescence is, and we
have briefly
considered the organs and structures which are chiefly
concerned in the
process. We have now to inquire what are the actual
phenomena which take
place during the act of detumescence.

Detumescence is normally linked closely to tumescence.
Tumescence is the
piling on of the fuel; detumescence is the leaping out

of the devouring
flame whence is lighted the torch of life to be handed
on from generation
to generation. The whole process is double and yet
single; it is exactly
analogous to that by which a pile is driven into the
earth by the raising
and then the letting go of a heavy weight which falls on
to the head of
the pile. In tumescence the organism is slowly wound up
and force
accumulated; in the act of detumescence the accumulated
force is let go
and by its liberation the sperm-bearing instrument is
driven home.
Courtship, as we commonly term the process of tumescence
which takes place
when a woman is first sexually approached by a man, is
usually a highly
prolonged process. But it is always necessary to
remember that every
repetition of the act of coitus, to be normally and
effectively carried
out on both sides, demands a similar double process;
detumescence must be
preceded by an abbreviated courtship.

This abbreviated courtship by which tumescence is
secured or heightened in
the repetition of acts of coitus which have become
familiar, is mainly
tactile.[98] Since the part of the man in coitus is more
active and that
of the woman more passive, the sexual sensitivity of the
skin seems to be
more pronounced in women. There are, moreover, regions
of the surface of a
woman's body where contact, when sympathetic, seems
specially liable to
arouse erotic excitement. Such erogenous zones are often
specially marked
in the breasts, occasionally in the palm of the hand,
the nape of the
neck, the lobule of the ear, the little finger; there
is, indeed, perhaps

no part of the surface of the body which may not, in some individuals at some time, become normally an erogenous zone. In hysteria the erotic excitability of these zones is sometimes very intense. The lips are, however, without doubt, the most persistently and poignantly sensitive region of the whole body outside the sphere of the sexual organs themselves. Hence the significance of the kiss as a preliminary of detumescence.[99]

The importance of the lips as a normal erogenous zone is shown by the experiments of Gualino. He applied a thread, folded on itself several times, to the lips, thus stimulating them in a simple mechanical manner. Of 20 women, between the ages of 18 and 35, only 8 felt this as a merely mechanical operation, 4 felt a vaguely erotic element in the proceeding, 3 experienced a desire for coitus and in 5 there was actual sexual excitement with emission of mucus. Of 25 men, between the ages of 20 and 30, in 15 all sexual feeling was absent, in 7 erotic ideas were suggested with congestion of the sexual organs without erection, and in 3 there was the beginning of erection. It should be added that both the women and the men in whom this sexual reflex was more especially marked were of somewhat nervous temperament; in such persons erotic reactions of all kinds generally occur most easily. (Gualino, "Il Riflesso Sessuale nell' eccitamento alle labbre," *Archivio di Psichiatria*, 1904, p. 341.)

As tumescence, under the influence of sensory stimulation, proceeds toward the climax when it gives place to detumescence, the physical phenomena become more and more acutely localized in the sexual organs. The process which was at first predominantly nervous and psychic now becomes more prominently vascular. The ancient sexual relationship of the skin asserts itself; there is marked surface congestion showing itself in various ways. The face tends to become red, and exactly the same phenomenon is taking place in the genital organs; "an erection," it has been said, "is a blushing of the penis." The difference is that in the genital organs this heightened vascularity has a definite and specific function to accomplish--the erection of the male organ which fits it to enter the female parts--and that consequently there has been developed in the penis that special kind of vascular mechanism, consisting of veins in connective tissue with unstriped muscular fibers, termed erectile tissue.[100]

It is not only the man who is supplied with erectile tissue which in the process of tumescence becomes congested and swollen. The woman also, in the corresponding external genital region, is likewise supplied with erectile tissue now also charged with blood, and exhibits the same changes as have taken place in her partner, though less conspicuously visible. In the anthropoid apes, as the gorilla, the large clitoris and the nymphæ become prominent in sexual excitement, but the less development of the clitoris in women, together with the specifically human

evolution of the mons veneris and larger lips, renders this sexual turgescence practically invisible, though it is perceptible to touch in an increased degree of spongy and elastic tension. The whole feminine genital canal, including the uterus, indeed, is richly supplied with blood-vessels, and is capable during sexual excitement of a very high degree of turgescence, a kind of erection.

The process of erection in woman is accompanied by the pouring out of fluid which copiously bathes all parts of the vulva around the entrance to the vagina. This is a bland, more or less odorless mucus which, under ordinary circumstances, slowly and imperceptibly suffuses the parts. When, however, the entrance to the vagina is exposed and extended, as during a gynæcological examination which occasionally produces sexual excitement, there may be seen a real ejaculation of the fluid which, as usually described, comes largely from the glands of Bartholin, situated at the mouth of the vagina. Under these circumstances it is sometimes described as being emitted in a jet which is thrown to a distance.[101] This mucous ejaculation was in former days regarded as analogous to the seminal ejaculation in man, and hence essential to conception. Although this belief was erroneous the fluid poured out in this manner whenever a high degree of tumescence is attained, and before the onset of detumescence, certainly performs an important function in lubricating the entrance to the genital canal and so facilitating the intromission of the male

organ.[102] Menstruation has a similar influence in facilitating coitus, as Schurig long since pointed out.[103] A like process takes place during parturition when the same parts are being lubricated and stretched in preparation for the protrusion of the foetal head. The occurrence of the mucous flow in tumescence always indicates that that process is actively affecting the central sexual organs, and that voluptuous emotions are present.[104]

The secretions of the genital canal and outlet in women are somewhat numerous. We have the odoriferous glands of sebaceous origin, and with them the prepuce of the clitoris which has been described as a kind of gigantic sebaceous follicle with the clitoris occupying its interior. (Hyrtl.) There is the secretion from the glands of Bartholin. There is again the vaginal secretion, opaque and albuminous, which appears to be alkaline when secreted, but becomes acid under the decomposing influence of bacteria, which are, however, harmless and not pathogenic. (Gow, Obstetrical Society of London, January 3, 1894.) There is, finally, the mucous uterine secretion, which is alkaline, and, being poured out during orgasm, is believed to protect the spermatozoa from destruction by the acid vaginal secretion.

The belief that the mucus poured out in women during sexual excitement is feminine semen and therefore essential to

conception had many remarkable consequences and was widespread until the seventeenth century. Thus, in the chapter "De Modo coeundi et de regimine eorum qui coeunt" of *De Secretis Mulierum*, there is insistence on the importance of the proper mixture of the male semen with the female semen and of arranging that it shall not escape from the vagina. The woman must lie quiet for several hours at least, not rising even to urinate, and when she gets up, be very temperate in eating and drinking, and not run or jump, pretending that she has a headache. It was the belief in feminine semen which led some theologians to lay down that a woman might masturbate if she had not experienced orgasm in coitus. Schurig in his *Muliebria* (1729, pp. 159, et seq.) discusses the opinions of old authors regarding the nature, source, and uses of the female genital secretions, and quotes authorities against the old view that it was female semen. In a subsequent work (*Syllepsilogia*, 1731, pp. 3, et seq.) he returns to the same question, quotes authors who accept a feminine semen, shows that Harvey denied it any significance, and himself decides against it. It has not seriously been brought forward since.

When erection is completed in both the man and the woman the conditions necessary for conjugation have at last been fulfilled. In all animals, even those most nearly allied to man, coitus is effected

by the male
approaching the female posteriorly. In man the normal
method of male
approach is anteriorly, face to face. Leonardo da Vinci,
in a well-known
drawing representing a sagittal section of a man and a
woman connected in
this position of so-called Venus obversa; has shown how
well adapted the
position is to the normal position of the organs in the
human
species.[105]

Among monkeys, it is stated, congress is sometimes
performed when
the female is on all fours; at other times the male
brings the
female between his thighs when he is sitting,
holding her with
his forepaws. Froriep informed Lawrence that the
male sometimes
supported his feet on the female's calves. (Sir W.
Lawrence,
Lectures on Physiology, 1823, p. 186.) A summary
of the methods
of congress practiced by the various animals below
mammals will
be found in the article "Copulation" by H. de
Varigny in Richet's
Dictionnaire de Physiologie, vol. iv.

The anterior position in coitus, with the female
partner lying
supine, is so widespread throughout the world that
it may fairly
be termed the most typically human attitude in
sexual congress.
It is found represented in Egyptian graves at
Benihassan,
belonging to the Twelfth Dynasty; it is regarded by
Mohammedans
as the normal position, although other positions are
permitted by
the Prophet: "Your wives are your tillage: go in
unto your

tillage in what manner soever you will;" it is that adopted in Malacca; it appears, from Peruvian antiquities, to have been the position generally, though not exclusively, adopted in ancient Peru; it is found in many parts of Africa, and seems also to have been the most usual position among the American aborigines.

Various modifications of this position are, however, found. Thus, in some parts of the world, as among the Suahelis in Zanzibar, the male partner adopts the supine position. In Loango, according to Pechuel-Loesche, coitus is performed lying on the side.

Sometimes, as on the west coast of Africa, the woman is supine and the man more or less erect; or, as among the Queenslanders (as described by Roth) the woman is supine and the man squats on his heels with her thighs clasping his flanks, while he raises her buttocks with his hands.

The position of coitus in which the man is supine is without doubt a natural and frequent variation of the specifically human obverse method of coitus. It was evidently familiar to the Romans. Ovid mentions it (*Ars Amatoria*, III, 777-8), recommending it to little women, and saying that Andromache was too tall to practice it with Hector. Aristophanes refers to it, and there are Greek epigrams in which women boast of their skill in riding their lovers. It has sometimes been viewed with a

certain disfavor because it seems to confer a superiority on the woman. "Cursed be he," according to a Mohammedan saying, "who maketh woman heaven and man earth."

Of special interest is the wide prevalence of an attitude in coitus recalling that which prevails among quadrupeds. The frequency with which on the walls of Pompeii coitus is represented with the woman bending forward and her partner approaching her posteriorly has led to the belief that this attitude was formerly very common in Southern Italy. However that may be, it is certainly normal at the present day among various more or less primitive peoples in whom the vulva is often placed somewhat posteriorly. It is thus among the Soudanese, as also, in an altogether different part of the world, among the Eskimo Innuits and Koniags. The New Caledonians, according to Foley, cohabit in the quadrupedal manner, and so also the Papuans of New Guinea (Bongu), according to Vahness. The same custom is also found in Australia, where, however other postures are also adopted. In Europe the quadrupedal posture would seem to prevail among some of the South Slavs, notably the Dalmatians. (The different methods of coitus practiced by the South Slavs are described in Kryptadia vol. vi, pp. 220, et seq.)

This method of coitus was recommended by Lucretius (lib. iv) and also advised by Paulus Aeginetus as favorable to

conception. (The opinions of various early physicians are quoted by Schurig, *Spermatologia*, 1720, pp. 232, et seq.). It seems to be a position that is not infrequently agreeable to women, a fact which may be brought into connection with the remarks of Adler already quoted (p. 131) concerning the comparative lack of adjustment of the feminine organs to the obverse position. It is noteworthy that in the days of witchcraft hysterical women constantly believed that they had had intercourse with the Devil in this manner. This circumstance, indeed, probably aided in the very marked disfavor in which coitus *a posteriori* fell after the decay of classic influences. The mediæval physicians described it as *mos diabolicus* and mistakenly supposed that it produced abortion (Hyrtl, op. cit., vol. ii, p. 87). The theologians, needless to say, were opposed to the *mos diabolicus*, and already in the Anglo-Saxon Penitential of Theodore, at the end of the seventh century, 40 days' penance is prescribed for this method of coitus.

From the frequency with which they have been adopted by various peoples as national customs, most of the postures in coitus here referred to must be said to come within the normal range of variation. It is a mistake to regard them as vicious perversions.

Up to the point to which we have so far considered it,

the process of
detumescence has been mainly nervous and vascular in
character; it has, in
fact, been but the more acute stage of a process which
has been going on
throughout tumescence. But now we reach the point at
which a new element
comes in: muscular action. With the onset of muscular
action, which is
mainly involuntary, even when it affects the voluntary
muscles,
detumescence proper begins to take place. Henceforward
purposeful psychic
action, except by an effort, is virtually abolished. The
individual, as a
separate person, tends to disappear. He has become one
with another
person, as nearly one as the conditions of existence
ever permit; he and
she are now merely an instrument in the hands of a
higher power--by
whatever name we may choose to call that Power--which is
using them for an
end not themselves.

The decisive moment in the production of the instinctive
and involuntary
orgasm occurs when, under the influence of the stimulus
applied to the
penis by friction with the vagina, the tension of the
seminal fluid poured
into the urethra arouses the ejaculatory center in the
spinal cord and the
bulbo-cavernosus muscle surrounding the urethra
responsively contracts in
rhythmic spasms. Then it is that ejaculation
occurs.[106]

"The circulation quickens, the arteries beat strongly,"
wrote Roubaud in a
description of the physical state during coitus which
may almost be termed
classic; "the venous blood, arrested by muscular
contraction, increases
the general heat, and this stagnation, more pronounced

in the brain by the contraction of the muscles of the neck and the throwing of the head backward, causes a momentary cerebral congestion, during which intelligence is lost and the faculties abolished. The eyes, violently injected, become haggard, and the look uncertain, or, in the majority of cases, the eyes are closed spasmodically to avoid the contact of the light. The respiration is hurried, sometimes interrupted, and may be suspended by the spasmodic contraction of the larynx, and the air, for a time compressed, is at last emitted in broken and meaningless words. The congested nervous centers only communicate confused sensations and volitions; mobility and sensation show extreme disorder; the limbs are seized by convulsions and sometimes by cramps, or are thrown wildly about or become stiff like iron bars. The jaws, tightly pressed, grind the teeth, and in some persons the delirium is carried so far that they bite to bleeding the shoulders their companions have imprudently abandoned to them. This frantic state of epilepsy lasts but a short time, but it suffices to exhaust the forces of the organism, especially in man. It is, I believe, Galen, who said: 'Omne animal post coitum triste præter mulierem gallumque.'"[107] Most of the elements that make up this typical picture of the state of coitus are not absolutely essential to that state, but they all come within the normal range of variation. There can be no doubt that this range is considerable. There would appear to be not only individual, but also racial, differences; there is a remarkable passage in

Vatsyayana's Kama Sutra describing the varying behavior of the women of different races in India under the stress of sexual excitement--Dravidian women with difficulty attaining erethism, women of the Punjab fond of being caressed with the tongue, women of Oude with impetuous desire and profuse flow of mucus, etc.--and it is highly probable, Ploss and Bartels remark, that these characterizations are founded on exact observations.[108]

The various phenomena included in Roubaud's description of the condition during coitus may all be directly or indirectly reduced to two groups: the first circulatory and respiratory, the second motor. It is necessary to consider both these aspects of the process of detumescence in somewhat greater detail, although while it is most convenient to discuss them separately, it must be borne in mind that they are not really separable; the circulatory phenomena are in large measure a by-product of the involuntary motor process.

With the approach of detumescence the respiration becomes shallow, rapid, and to some extent arrested. This characteristic of the breathing during sexual excitement is well recognized; so that in, for instance, the Arabian Nights, it is commonly noted of women when gazing at beautiful youths whose love they desired, that they ceased breathing.[109] It may be added that exactly the same tendency to superficial and arrested respiration takes place whenever there is any intense mental concentration, as in severe intellectual work.[110]

The arrest of respiration tends to render the blood venous, and thus aids in stimulating the vasomotor centers, raising the blood-pressure in the body generally, and especially in the erectile tissues. High blood-pressure is one of the most marked features of the state of detumescence. The heart beats are stronger and quicker, the surface arteries are more visible, the conjunctivæ become red. The precise degree of blood-pressure attained during coitus has been most accurately ascertained in the dog. In Bechterew's laboratory in St. Petersburg a manometer was introduced into the central end of the carotid artery of a bitch; a male dog was then introduced, and during coitus observations were made on the blood-pressure at the peripheral and central ends of the artery. It was found that there was a great general elevation of blood-pressure, intense hyperæmia of the brain, rapid alternations, during the act, of vasoconstriction and vasodilatation of the brain, with increase and diminution of the general arterial tension in relation with the various phases of the act, the greatest cerebral vasodilatation and hyperæmia coinciding with the moment following the intromission of the penis; the end of the act is followed by a considerable fall in the blood-pressure.[111] I am not acquainted with any precise observations on the blood-pressure in human subjects during detumescence, and there are obvious difficulties in the way of such observations. It is probable, however, that the conditions found would be substantially the same. This

is indicated, so far as the very marked increase of blood-pressure is concerned, by some observations made by Vaschide and Vurpas with the sphygmanometer on a lady under the influence of sexual excitement. In this case there was a relationship of sympathy and friendly tenderness between the experimenter and the subject, Madame X, aged 25. Experimenter and subject talked sympathetically, and finally, we are told, while the latter still had her hands in the sphygmanometer, the former almost made a declaration of love. Madame X was greatly impressed, and afterward admitted that her emotions had been genuine and strong. The blood-pressure, which was in this subject habitually 65 millimeters, rose to 150 and even 160, indicating a very high pressure, which rarely occurs; at the same time Madame X looked very emotional and troubled.[112]

Some authorities are of opinion that irregularities in the accomplishment of the sexual act are specially liable to cause disturbances in the circulation. Thus Kisch, of Prague, refers to the case of a couple practising coitus interruptus--the husband withdrawing before ejaculation--in which the wife, a vigorous woman, became liable after some years to attacks termed by Kisch neurasthenia cordis vasomotoria, in which there was at daily or longer intervals palpitation, with feelings of anxiety, headache, dizziness, muscular weakness and tendency to faint. He regards coitus as a cause of various heart troubles in women: (1) Attacks

of tachycardia in very excitable and sexually inclined women; (2) attacks of tachycardia with dyspnoea in young women, with vaginismus; (3) cardiac symptoms with lowered vascular tone in women who for a long time have practised coitus interruptus without complete sexual gratification (Kisch, "Herzbeschwerden der Frauen verursacht durch den Cohabitationsact," Münchener Medizinisches Wochenschrift, 1897, p. 617). In this connection, also, reference may probably be made to those attacks of anxiety which Freud associates with psychic sexual lesions of an emotional character.

Associated with this vascular activity in detumescence we find a general tendency to glandular activity. Various secretions are formed abundantly. Perspiration is copious, and the ancient relationship between the cutaneous and sexual systems seems to evoke a general activity of the skin and its odoriferous secretions. Salivation, which also occurs, is very conspicuous in many lower animals, as for instance in the donkey, notably the female, who just before coitus stands with mouth open, jaws moving, and saliva dribbling. In men, corresponding to the more copious secretion in women, there is, during the latter stages of tumescence, a slight secretion of mucus--Fürbringer's urethrorrhoea ex libidine--which appears in drops at the urethral orifice. It comes from the small glands of Littré and Cowper which open into the urethra. This phenomenon was well known to the old theologians, who called it

distillatio, and realized its significance as at once distinct from semen and an indication that the mind was dwelling on voluptuous images; it was also known in classic times[113]; more recently it has often been confused with semen and has thus sometimes caused needless anxiety to nervous persons. There is also an increased secretion of urine, and it is probable that if the viscera were more accessible to observation we might be able to demonstrate that the glands throughout the body share in this increased activity.

The phenomena of detumescence culminate, however, and have their most obvious manifestation in motor activity. The genital act, as Vaschide and Vurpas remark, consists essentially in "a more and more marked tension of the motor state which, reaching its maximum, presents a short tonic phase, followed by a clonic phase, and terminates in a period of adynamia and repose." This motor activity is of the essence of the impulse of detumescence, because without it the sperm cells could not be brought into the neighborhood of the germ cell and be propelled into the organic nest which is assigned for their conjunction and incubation.

The motor activity is general as well as specifically sexual. There is a general tendency to more or less involuntary movement, without any increase of voluntary muscular power, which is, indeed, decreased, and Vaschide and Vurpas state that dynamometric results are somewhat lower than normal during sexual excitement, and the variations greater.[114] The tendency to diffused activity of involuntary muscle is

well illustrated by the contraction of the bladder associated with detumescence. While this occurs in both sexes, in men erection produces a mechanical impediment to any evacuation of the bladder. In women there is not only a desire to urinate but, occasionally, actual urination. Many quite healthy and normal women have, as a rare accident supervening on the coincidence of an unusually full bladder with an unusual degree of sexual excitement, experienced a powerful and quite involuntary evacuation of the bladder at the moment of orgasm. In women with less normal nervous systems this has, more rarely, been almost habitual. Brantôme has perhaps recorded the earliest case of this kind in referring to a lady he knew who "quand on lui faisait cela elle se compissait à bon escient." [115] The tendency to trembling, constriction of throat, sneezing, emission of internal gas, and the other similar phenomena occasionally associated with detumescence, are likewise due to diffusion of the motor disturbance. Even in infancy the motor signs of sexual excitement are the most obvious indications of orgasm; thus West, describing masturbation in a child of six or nine months who practiced thigh-rubbing, states that when sitting in her high chair she would grasp the handles, stiffen herself, and stare, rubbing her thighs quickly together several times, and then come to herself with a sigh, tired, relaxed, and sweating, these seizures, which lasted one or two minutes, being mistaken by the relations for epileptic fits. [116]

The essentially motor character of detumescence is

well shown by
the extreme forms of erotic intoxication which
sometimes appear
as the result of sexual excitement. Féré, who has
especially
called attention to the various manifestations of
this condition,
presents an instructive case of a man of neurotic
heredity and
antecedents, in whom it occasionally happened that
sexual
excitement, instead of culminating in the normal
orgasm, attained
its climax in a fit of uncontrollable muscular
excitement. He
would then sing, dance, gesticulate, roughly treat
his partner,
break the objects around him, and finally sink down
exhausted and
stupefied. (Féré, L'Instinct Sexuel, Chapter X.)
In such a case
a diffused and general detumescence has taken the
place of the
normal detumescence which has its main focus in the
sexual
sphere.

The same relationship is shown in a case of
impotence accompanied
by cramps in the calves and elsewhere, which has
been recorded by
Brügelmann ("Zur Lehre vom Perversen Sexualismus,"
Zeitschrift
für Hypnotismus, 1900, Heft I). These muscular
conditions ceased
for several days whenever coitus was effected.

An instructive analogy to the motor irradiations
preceding the
moment of sexual detumescence may be found in the
somewhat
similar motor irradiations which follow the delayed
expulsion of
a highly distended bladder. These sometimes become
very marked in

a child or young woman unable to control the motor system absolutely. The legs are crossed, the foot swung, the thighs tightly pressed together, the toes curled. The fingers are flexed in rhythmic succession. The whole body slowly twists as though the seat had become uncomfortable. It is difficult to concentrate the mind; the same remark may be automatically repeated; the eyes search restlessly, and there is a tendency to count surrounding objects or patterns. When the extreme degree of tension is reached it is only by executing a kind of dance that the explosive contraction of the bladder is restrained.

The picture of muscular irradiation presented under these circumstances differs but slightly from that of the onset of detumescence. In one case the explosion is sought, in the other case it is dreaded; but in both cases there is a retarded muscular tension,--in the one case involuntary, in the other case voluntary--maintained at a point of acute intensity, and in both cases the muscular irradiations of this tension spread over the whole body.

The increased motor irritability of the state of detumescence somewhat resembles the conditions produced by a weak anæsthetic and there is some interest in noting the sexual excitement liable to occur in anæsthesia. I am indebted to Dr. J.F.W. Silk for some remarks on this point:--

"I. Sexual emotions may apparently be aroused during the stage of excitement preceding or following the administration of any anæsthetic; these emotions may take the form of mere delirious utterances, or may be associated with what is apparently a sexual orgasm. Or reflex phenomena connected with the sexual organs may occasionally be observed under special circumstances; or, to put it in another way, such reflex possibilities are not always abolished by the condition of narcosis or anæsthesia.

"II. Of the particular anæsthetics employed I am inclined to think that the possibility of such conditions arising is inversely proportionate to their strength, e.g., they are more frequently observed with a weak anæsthetic like nitrous oxide than with chloroform.

"III. Sexual emotions I believe to be rarely observable in men, and this is remarkable, or, I should say, particularly noticeable, for the presence of nurses, female students, etc., might almost have led one to expect that the contrary would have been the case. On the other hand, it is among men that I have frequently observed a reflex phenomenon which has usually taken the shape of an erection of the penis when the structures in the neighborhood of the spermatic cord have been handled.

"IV. Among females the emotional sexual phenomena most frequently obtrude themselves, and I believe that if it were possible to induce people to relate their dreams they would very often be found to be of a sexual character."

Much more important than the general motor phenomena, more purposive though involuntary, are the specifically sexual muscular movements. From the very beginning of detumescence, indeed, muscular activity makes itself felt, and the peripheral muscles of sex act, according to Kobelt's expression, as a peripheral sexual heart. In the male these movements are fairly obvious and fairly simple. It is required that the semen should be expressed from the vesiculæ seminales, propelled along the urethra, in combination with the prostatic fluid which is equally essential, and finally ejected with a certain amount of force from the urethral orifice. Under the influence of the stimulation furnished by the contact and friction of the vagina, this process is effectively carried out, mainly by the rhythmic contractions of the bulbo-cavernosus muscle, and the semen is emitted in a jet which may be ejaculated to a distance varying from a few centimeters to a meter or more.

With regard to the details of the psychic sides of this process a correspondent, a psychologist, writes as follows:--

"I have never noticed in my reading any attempt to analyze the sensations which accompany the orgasm, and, as I have made a good many attempts to make such an analysis myself, I

will append the
results on the chance that they may be of some
value. I have
checked my results so far as possible by comparing
them with the
experience of such of my friends as had coitus
frequently and
were willing to tell me as much as they could of the
psychology
of the process.

"The first fact that I hit upon was the importance
of pressure.
As one of my informants picturesquely phrases it--
'the tighter
the fit the greater the pleasure.' This agrees, too,
with their
unanimous testimony that the pleasurable sensations
were much
greater when the orgasm occurred simultaneously in
the man and
woman. Their analysis seldom went further than this,
but a few
remarked that the distinctive sensations
accompanying the orgasm
seem to begin near the root of the penis or in the
testes, and
that they are qualitatively different from the
tickling
sensations which precede them.

"These tickling sensations are caused, I think, by
the friction
of the glands against the vaginal walls, and are
supplemented by
other sensations from the urethra, whose nerves are
stimulated by
pressure of the vaginal walls and sphincter. The
specific
sensation of the orgasm begins, I believe, with a
strong
contraction of the muscles of the urethral walls
along the entire
length of the canal, and is felt as a peculiar ache
starting

from the base of the penis and quickly becoming diffused through the whole organ. This sensation reaches its climax with the expulsion of the semen into the urethra and the consequent feeling of distention, which is instantly followed by the rhythmic peristaltic contractions of the urethral muscles which mark the climax of the orgasm.

"The most careful introspection possible under the circumstances seems to show that these sensations arise almost wholly from the urethra and in a far less degree from the corona. During periods of great sexual excitement the nerves of the urethra and corona seem to possess a peculiar sensitivity and are powerfully stimulated by the violent peristaltic contractions of the muscles in the urethral walls during ejaculation. It seems possible that the intensity and volume of sensation felt at the glans may be due in part to the greater area of sensitive surface presented in the fossa as well as to the sensitivity of the corona, and in part to the fact that during the orgasm the glans is more highly congested than at any other time, and the nerve endings thus subjected to additional pressure.

"If the foregoing statements are true, it is easy to see why the pleasure of the man is much increased when the orgasm occurs at the same time in his partner and himself, for the contractions of the vagina upon the penis would increase the

stimulation of all
the nerve endings in that organ for which a
mechanical stimulus
is adequate, and the prominence of the corpus
spongiosum and
corona would ensure them the greatest stimulation.
It seems not
improbable that the specific sensation of orgasm
rises from the
stimulation of the peculiar form of nerve end-bulbs
which Krause
found in the corpus spongiosum and in the glans.

"The characteristic massiveness of the experience is
probably due
largely to the great number of sensations of strain
and pressure
caused by the powerful reflex contraction of so many
of the
voluntary muscles.

"Of course, the foregoing analysis is purely
tentative, and I
offer it only on the chance that it may suggest some
line of
inquiry which may lead to results of value to the
student of
sexual psychology."

In man the whole process of detumescence, when it
has once really
begun, only occupies a few moments. It is so
likewise in many
animals; in the genera *Bos*, *Ovis*, etc., it is very
short, almost
instantaneous, and rather short also in the *Equidæ*
(in a vigorous
stallion, according to Colin, ten to twelve
seconds). As
Disselhorst has pointed out, this is dependent on
the fact that
these animals, like man, possess a *vas deferens*
which broadens
into an *ampulla* serving as a receptacle which holds
the semen

ready for instant emission when required. On the other hand, in the dog, cat, boar, and the Canidæ, Felidæ, and Suidæ generally, there is no receptacle of this kind, and coitus is slow, since a longer time is required for the peristaltic action of the vas to bring the semen to the urogenital sinus. (R. Disselhorst, *Die Accessorischen Geschlechtsdrusen der Wirbelthiere*, 1897, p. 212.)

In man there can be little doubt that detumescence is more rapidly accomplished in the European than in the East, in India, among the yellow races, or in Polynesia. This is probably in part due to a deliberate attempt to prolong the act in the East, and in part to a greater nervous erethism among Westerns.

In the woman the specifically sexual muscular process is less visible, more obscure, more complex, and uncertain. Before detumescence actually begins there are at intervals involuntary rhythmic contractions of the walls of the vagina, seeming to have the object of at once stimulating and harmonizing with those that are about to begin in the male organ. It would appear that these rhythmic contractions are the exaggeration of a phenomenon which is normal, just as slight contraction is normal and constant in the bladder. Jastreboff has shown, in the rabbit, that the vagina is in constant spontaneous rhythmic contraction from above downward, not peristaltic, but in segments, the intensity of the

contractions increasing with age and especially with sexual development. This vaginal contraction which in women only becomes well marked just before detumescence, and is due mainly to the action of the sphincter cunni (analogous to the bulbo-cavernosus in the male), is only a part of the localized muscular process. At first there would appear to be a reflex peristaltic movement of the Fallopian tubes and uterus. Dembo observed that in animals stimulation of the upper anterior wall of the vagina caused gradual contraction of the uterus, which is erected by powerful contraction of its muscular fiber and round ligaments while at the same time it descends toward the vagina, its cavity becoming more and more diminished and mucus being forced out. In relaxing, Aristotle long ago remarked, it aspirates the seminal fluid.

Although the active participation of the sexual organs in woman, to the end of directing the semen into the womb at the moment of detumescence, is thus a very ancient belief, and harmonizes with the Greek view of the womb as an animal in the body endowed with a considerable amount of activity,[117] precise observation in modern times has offered but little confirmation of the reality of this participation. Such observations as have been made have usually been the accidental result of sexual excitement and orgasm occurring during a gynæcological examination. As, however, such a result is liable to occur in erotic subjects, a certain number of precise observations have accumulated during the past century. So far as the evidence goes, it would seem that in

women, as in mares,
bitches, and other animals, the uterus becomes shorter,
broader, and
softer during the orgasm, at the same time descending
lower into the
pelvis, with its mouth open intermittently, so that, as
one writer
remarks, spontaneously recurring to the simile which
commended itself to
the Greeks, "the uterus might be likened to an animal
gasping for
breath." [118] This sensitive, responsive mobility of the
uterus is,
indeed, not confined to the moment of detumescence, but
may occur at other
times under the influence of sexual emotion.

It would seem probable that in this erection,
contraction, and descent of
the uterus, and its simultaneous expulsion of mucus, we
have the decisive
moment in the completion of detumescence in woman, and
it is probable that
the thick mucus, unlike the earlier more limpid
secretion, which women are
sometimes aware of after orgasm, is emitted from the
womb at this time.
This is, however, not absolutely certain. Some
authorities regard
detumescence in women as accomplished in the pouring out
of secretions,
others in the rhythmic genital contractions; the sexual
parts may,
however, be copiously bathed in mucus for an
indefinitely long period
before the final stage of detumescence is achieved, and
the rhythmic
contractions are also taking place at a somewhat early
period; in neither
respect is there any obvious increase at the final
moment of orgasm. In
women this would seem to be more conspicuously a nervous
manifestation
than in men. On the subjective side it is very
pronounced, with its

feeling of relieved tension and agreeable repose--a moment when, as one woman expresses it, together with intense pleasure, there is, as it were, a floating up into a higher sphere, like the beginning of chloroform narcosis--but on the objective side this culminating moment is less easy to define.

Various observations and remarks made during the past two or three centuries by Bond, Valisneri, Dionis, Haller, Günther, and Bischoff, tending to show a sucking action of the uterus in both women and other female animals, have been brought together by Litzmann in R. Wagner's Handwörterbuch der Physiologie (1846, vol. iii, p. 53). Litzmann added an experience of his own: "I had an opportunity lately, while examining a young and very erethic woman, to observe how suddenly the uterus assumed a more erect position, and descended deeper in the pelvis; the lips of the womb became equal in length, the cervix rounded, softer, and more easily reached by the finger, and at the same time a high state of sexual excitement was revealed by the respiration and voice."

The general belief still remained, however, that the woman's part in conjugation is passive, and that it is entirely by the energy of the male organ and of the male sexual elements, the spermatozoa, that conjunction with the germ cell is attained.

According to this theory, it was believed that the spermatozoa

were, as Wilkinson expresses it, in a history of opinion on this question, "endowed with some sort of intuition or instinct; that they would turn in the direction of the os uteri, wading through the acid mucus of the vagina; travel patiently upward and around the vaginal portion of the uterus; enter the uterus and proceed onward in search of the waiting ovum." (A.D. Wilkinson, "Sterility in the Female," Transactions of the Lincoln Medical Society, Nebraska, 1896.)

About the year 1859 Fichstedt seems to have done something to overthrow this theory by declaring his belief that the uterus was not, as commonly supposed, a passive organ in coitus, but was capable of sucking in the semen during the brief period of detumescence. Various authorities then began to bring forward arguments and observations in the same sense. Wernich, especially, directed attention to this point in 1872 in a paper on the erectile properties of the lower segment of the uterus ("Die Erectionsfähigkeit des untern Uterus-Abschnitts," Beiträge zur Geburtshülfe und Gynäkologie, vol. i, p. 296). He made precise observations and came to the conclusion that owing to erectile properties in the neck of the uterus, this part of the womb elongates during congress and reaches down into the pelvis with an aspiratory movement, as if to meet the glans of the male. A little later, in a case of partial prolapse, Beck,

in ignorance

of Wernich's theory, was enabled to make a very precise

observation of the action of the uterus during excitement. In

this case the woman was sexually very excitable even under

ordinary examination, and Beck carefully noted the phenomena that

took place during the orgasm. "The os and cervix uteri," he

states, "had been about as firm as usual, moderately hard and,

generally speaking, in a natural and normal condition, with the

external os closed to such an extent as to admit of the uterine

probe with difficulty; but the instant that the height of

excitement was at hand, the os opened itself to the extent of

fully an inch, as nearly as my eye can judge, made five or six

successive gasps as if it were drawing the external os into the

cervix, each time powerfully, and, it seemed to me, with a

regular rhythmical action, at the same time losing its former

density and hardness and becoming quite soft to the touch. Upon

the cessation of the action, as related, the os suddenly closed,

the cervix again hardened itself, and the intense congestion was

dissipated." (J.R. Beck, "How do the Spermatozoa Enter the

Uterus?" American Journal of Obstetrics, 1874.) It would appear

that in the early part of this final process of detumescence the

action of the uterus is mainly one of contraction and ejaculation

of any mucus that may be contained; Dr. Paul Mundé has described

"the gushing, almost in jets," of this mucus which he has

observed in an erotic woman under a rather long digital and

specular examination. (_American Journal of Obstetrics_, 1893.)

It is during the latter part of detumescence, it would seem, and

perhaps for a short time after the orgasm is over, that the

action of the uterus is mainly aspiratory.

While the active part played by the womb in detumescence can no longer be

questioned, it need not too hastily be assumed that the belief in the

active movements of the spermatozoa must therefore be denied. The vigorous

motility of the tadpole-like organisms is obvious to anyone who has ever

seen fresh semen under the microscope; and if it is correct, as Clifton

Edgar states, that the spermatozoa may retain their full activity in the

female organs for at least seventeen days, they have ample time to exert

their energies. The fact that impregnation sometimes occurs without

rupture of the hymen is not decisive evidence that there has been no

penetration, as the hymen may dilate without rupturing; but there seems no

reason to doubt that conception has sometimes taken place when ejaculation

has occurred without penetration; this is indicated in a fairly objective

manner when, as has been occasionally observed, conception has occurred in

women whose vaginas were so narrow as scarcely to admit the entrance of a

goose-quill; such was the condition in the case of a pregnant woman

brought forward by Roubaud. The stories, repeated in various books, of

women who have conceived after homosexual relations with

partners who had just left their husbands' beds are not therefore inherently impossible.[119] Janke quotes numerous cases in which there has been impregnation in virgins who have merely allowed the penis to be placed in contact with the vulva, the hymen remaining unruptured until delivery.[120]

It must be added, however, that even if the semen is effused merely at the mouth of the vagina, without actual penetration, the spermatozoa are still not entirely without any resource save their own motility in the task of reaching the ovum. As we have seen, it is not only the uterus which takes an active part in detumescence; the vagina also is in active movement, and it seems highly probable that, at all events in some women and under some circumstances, such movement favoring aspiration toward the womb may be communicated to the external mouth of the vagina.

Riolan (*Anthropographia*, 1626, p. 294) referred to the constriction and dilation of the vulva under the influence of sexual excitement. It is said that in Abyssinia women can, when adopting the straddling posture of coitus, by the movements of their own vaginal muscles alone, grasp the male organ and cause ejaculation, although the man remains passive. According to Lorion the Annamites, adopting the normal posture of coitus, introduce the penis when flaccid or only half erect, the contraction of the vaginal walls completing the process; the

penis is very small in this people. It is recognized by gynæcologists that the condition of vaginismus, in which there is spasmodic contraction of the vagina, making intercourse painful or impossible, is but a morbid exaggeration of the normal contraction which occurs in sexual excitement. Even in the absence of sexual excitement there is a vague affection, occurring in both married and unmarried women, and not, it would seem, necessarily hysterical, characterized by quivering or twitching of the vulva; I am told that this is popularly termed "flackering of the shape" in Yorkshire and "taittering of the lips" in Ireland. It may be added that quivering of the gluteal muscles also takes place during detumescence, and that in Indian medicine this is likewise regarded as a sign of sexual desire in women, apart from coitus.

A non-medical correspondent in Australia, W.J. Chidley, from whom I have received many communications on this subject, is strongly of opinion from his own observations that not only does the uterus take an active part in coitus, but that under natural conditions the vagina also plays an active part in the process. He was led to suspect such an action many years ago, as well by an experience of his own, as also by hearing from a young woman who met her lover after a long absence that by the excitement thus aroused a tape attached to the underclothes had

been drawn
into the vagina. Since then the confidences of
various friends,
together with observations of animals, have
confirmed him in the
view that the general belief that coitus must be
effected by
forcible entry of the male organ into a passive
vagina is
incorrect. He considers that under normal
circumstances coitus
should take place but rarely, and then only under
the most
favorable circumstances, perhaps exclusively in
spring, and, most
especially, only when the woman is ready for it.
Then, when in
the arms of the man she loves, the vagina, in
sympathy with the
active movements of the womb, becomes distended at
the touch of
the turgescient, but not fully erect, penis, "flashes
open and
draws in the male organ." "All animals," he adds,
"have sexual
intercourse by the male organ being drawn, not
forced, into the
female. I have been borne out in this by friends who
have seen
horses, camels, mules and other large animals in the
coupling
season. What is more absurd, for instance, than to
say that an
entire penetrates the mare? His penis is a
sensitive, beautiful
piece of mechanism, which brings its light head here
and there
till it touches the right spot, when the mare, if
ready, takes
it in. An entire's penis could not penetrate
anything; it is a
curve, a beautiful curve which would easily bend. A
bull's,
again, is turned down at the end and, more palpably
still, would

fold on itself if pressed with force. The womb and vagina of a beautiful and healthy woman constitute a living, vital, moving organ, sensitive to a look, a word, a thought, a hand on the waist."

A well-known American author thus writes in confirmation of the foregoing view: "In nature the woman woos. When impassioned her vagina becomes erect and dilated, and so lubricated with abundant mucus to the lips that entrance is easy. This dilatation and erectile expansion of vagina withdraws the hymen so close to the walls that penetration need not tear it or cause pain. The more muscular, primitive and healthy the woman the tougher and less sensitive the hymen, and the less likely to break or bleed. I think one great function of the foreskin also is to moisten the glans, so that it can be lubricated for entrance, and then to retract, moist side out, to make entrance still easier. I think that in nature the glans penetrates within the labia, is withstood a moment, vibrating, and then all resistance is withdrawn by a sudden 'flashing open' of the gates, permitting easy entrance, and that the sudden giving up of resistance, and substitution of welcome, with its instantaneous deep entrance, causes an almost immediate male orgasm (the thrill being irresistibly exciting). Certainly this is the process as observed in horses, cattle, goats, etc., and it seems likely

something
analogous is natural in man."

While it is easily possible to carry to excess a view which would make the woman rather than the man the active agent in coitus (and it may be recalled that in the Cebidæ the penis, as also the clitoris, is furnished with a bone), there is probably an element of truth in the belief that the vagina shares in the active part which, there can now be little doubt, is played by the uterus in detumescence. Such a view certainly enables us to understand how it is that semen effused on the exterior sexual organs can be conveyed to the uterus.

It was indeed the failure to understand the vital activity of the semen and the feminine genital canal, co-operating together towards the junction of sperm cell and germ cell, which for so long stood in the way of the proper understanding of conception. Even the genius of Harvey, which had grappled successfully with the problem of the circulation, failed in the attempt to comprehend the problem of generation. Mainly on account of this difficulty, he was unable to see how the male element could possibly enter the uterus, although he devoted much observation and study to the question. Writing of the uterus of the doe after copulation, he says: "I began to doubt, to ask myself whether the semen of the male could by any possibility make its way by

attraction or injection to the seat of conception,
and repeated
examination led me to the conclusion that none of
the semen
reached this seat." (De-Generazione Animalium,
Exercise lxvii.)
"The woman," he finally concluded, "after contact
with the
spermatic fluid in coitu, seems to receive an
influence and
become fecundated without the co-operation of any
sensible
corporeal agent, in the same way as iron touched by
the magnet is
endowed with its powers."

Although the specifically sexual muscular process of
detumescence in
women--as distinguished from the general muscular
phenomena of sexual
excitement which may be fairly obvious--is thus seen to
be somewhat
complex and obscure, in women as well as in men
detumescence is a
convulsion which discharges a slowly accumulated store
of nervous force.
In women also, as in men, the motor discharge is
directed to a specific
end--the intromission of the semen in the one sex, its
reception in the
other. In both sexes the sexual orgasm and the pleasure
and satisfaction
associated with it, involve, as their most essential
element, the motor
activity of the sexual sphere.[121]

The active co-operation of the female organs in
detumescence is
probably indicated by the difficulty which is
experienced in
achieving conception by the artificial injection of
semen. Marion
Sims stated in 1866, in Clinical Notes on Uterine
Surgery, that
in 55 injections in six women he had only once been

successful;

he believed that that was the only case at that time on record.

Jacobi had, however, practiced artificial fecundation in animals

(in 1700) and John Hunter in man. See Gould and Pyle, *Anomalies*

and *Curiosities of Medicine*, p. 43; also Janke (*Die*

Willkürliche Hervorbringen des Geschlechts, pp. 230 et seq.) who

discusses the question of artificial fecundation and brings

together a mass of data.

The facial expression when tumescence is completed is marked by a high

degree of energy in men and of loveliness in women. At this moment, when

the culminating act of life is about to be accomplished, the individual

thus reaches his supreme state of radiant beauty. The color is heightened,

the eyes are larger and brighter, the facial muscles are more tense, so

that in mature individuals any wrinkles disappear and youthfulness

returns.

At the beginning of detumescence the features are frequently more

discomposed. There is a general expression of eager receptivity to sensory

impressions. The dilatation of the pupils, the expansion of the nostrils,

the tendency to salivation and to movements of the tongue, all go to make

up a picture which indicates an approaching gratification of sensory

desires; it is significant that in some animals there is at this moment

erection of the ears.[122] There is sometimes a tendency to utter broken

and meaningless words, and it is noted that sometimes women have called

out on their mothers.[123] The dilatation of the pupils produces photophobia, and in the course of detumescence the eyes are frequently closed from this cause. At the beginning of sexual excitement, Vaschide and Vurpas have observed, tonicity of the eye-muscles seems to increase; the elevators of the upper lids contract, so that the eyes look larger and their mobility and brightness are heightened; with the increase of muscular tonicity strabismus occurs, owing to the greater strength of the muscles that carry the eyes inward.[124]

The facial expression which marks the culmination of tumescence, and the approach of detumescence is that which is generally expressive of joy. In an interesting psycho-physical study of the emotion of joy, Dearborn thus summarizes its characteristics:

"The eyes are brighter and the upper eyelid elevated, as also are the brows, the skin over the glabella, the upper lip and the corners of the mouth, while the skin at the outer canthi of the eye is puckered. The nostrils are moderately dilated, the tongue slightly extended and the cheeks somewhat expanded, while in persons with largely developed pinnal muscles the ears tend somewhat to incline forwards. The whole arterial system is dilated, with consequent blushing from this effect on the dermal capillaries of the face, neck, scalp and hands, and sometimes more extensively even; from the same cause the eyes slightly bulge. The whole glandular system likewise is

stimulated, causing
the secretions,--gastric, salivary, lachrymal,
sudoral, mammary,
genital, etc.--to be increased, with the resulting
rise of
temperature and increase in the katobolism
generally. Volubility
is almost regularly increased, and is, indeed, one
of the most
sensitive and constant of the correlations in
emotional
delight.... Pleasantness is correlated in living
organisms by
vascular, muscular and glandular extension or
expansion, both
literal and figurative." (G. Dearborn, "The Emotion
of Joy,"
Psychological Review Monograph Supplements, vol.
ii, No. 5, p.
62.) All these signs of joy appear to occur at some
stage of the
process of sexual excitement.

In some monkeys it would seem that the muscular
movement which in
man has become the smile is the characteristic
facial expression
of sexual tumescence or courtship. Discussing the
facial
expression of pleasure in children, S.S. Buckman has
the
following remarks: "There is one point in such
expression which
has not received due consideration, namely, the
raising of lumps
of flesh each side of the nose as an indication of
pleasure.
Accompanying this may be seen small furrows, both in
children and
adults, running from the eyes somewhat obliquely
towards the
nose. What these characters indicate may be learned
from the male
mandril, whose face, particularly in the breeding
season, shows

colored fleshy prominences each side of the nose,
with
conspicuous furrows and ridges. In the male mandril
these
characters have been developed because, being an
unmistakable
sign of sexual ardor, they gave the female
particular evidence of
sexual feelings. Thus such characters would come to
be recognized
as habitually symptomatic of pleasurable feelings.
Finding
similar features in human beings, and particularly
in children,
though not developed in the same degree, we may
assume that in
our monkey-like ancestors facial characters similar
to those of
the mandril were developed, though to a less extent,
and that
they were symptomatic of pleasure, because connected
with the
period of courtship. Then they became
conventionalized as
pleasurable symptoms." (S.S. Buckmann, "Human
Babies: What They
Teach," Nature, July 5, 1900.) If this view is
accepted, it may
be said that the smile, having in man become a
generalized sign
of amiability, has no longer any special sexual
significance. It
is true that a faint and involuntary smile is often
associated
with the later stages of tumescence, but this is
usually lost
during detumescence, and may even give place to an
expression of
ferocity.

When we have realized how profound is the organic
convulsion involved by
the process of detumescence, and how great the general
motor excitement
involved, we can understand how it is that very serious

effects may follow coitus. Even in animals this is sometimes the case. Young bulls and stallions have fallen in a faint after the first congress; boars may be seriously affected in a similar way; mares have been known even to fall dead.[125] In the human species, and especially in men--probably, as Bryan Robinson remarks, because women are protected by the greater slowness with which detumescence occurs in them--not only death itself, but innumerable disorders and accidents have been known to follow immediately after coitus, these results being mainly due to the vascular and muscular excitement involved by the processes of detumescence. Fainting, vomiting, urination, defæcation have been noted as occurring in young men after a first coitus. Epilepsy has been not infrequently recorded. Lesions of various organs, even rupture of the spleen, have sometimes taken place. In men of mature age the arteries have at times been unable to resist the high blood-pressure, and cerebral hæmorrhage with paralysis has occurred. In elderly men the excitement of intercourse with strange women has sometimes caused death, and various cases are known of eminent persons who have thus died in the arms of young wives or of prostitutes.[126]

These morbid results, are, however, very exceptional. They usually occur in persons who are abnormally sensitive, or who have imprudently transgressed the obvious rules of sexual hygiene. Detumescence is so profoundly natural a process; it is so deeply and intimately a function of the organism, that it is frequently harmless even when

the bodily condition is far from absolutely sound. Its usual results, under favorable circumstances, are entirely beneficial. In men there normally supervenes, together with the relief from the prolonged tension of tumescence, with the muscular repose and falling blood-pressure,[127] a sense of profound satisfaction, a glow of diffused well-being,[128] perhaps an agreeable lassitude, occasionally also a sense of mental liberation from an overmastering obsession. Under reasonably happy circumstances there is no pain, or exhaustion, or sadness, or emotional revulsion. The happy lover's attitude toward his partner is not expressed by the well-known Sonnet (CXXIX) of Shakespeare:--

"Past reason hunted, and no sooner had
Past reason hated."

He feels rather with Boccaccio that the kissed mouth loses not its charm,

"Bocca baciata non perde ventura."

In women the results of detumescence are the same, except that the tendency to lassitude is not marked unless the act has been several times repeated; there is a sensation of repose and self-assurance, and often an accession of free and joyous energy. After completely satisfactory detumescence she may experience a feeling as of intoxication, lasting for several hours, an intoxication that is followed by no evil reaction.

Such, so far as our present vague and imperfect knowledge extends, are the main features in the process of detumescence. In the

future, without doubt, we shall learn to know more precisely a process which has been so supremely important in the life of man and of his ancestors.

FOOTNOTES:

[98] The elements furnished by the sense of touch in sexual selection have been discussed in the first section of the previous volume of these Studies.

[99] See Appendix A. "The Origins of the Kiss," in the previous volume.

[100] See, e.g., Art. "Erection," by Retterer, in Richet's Dictionnaire de Physiologie, vol. v.

[101] Guibaut, Traité Clinique des Maladies des Femmes, p. 242. Adler discusses the sexual secretions in women and their significance, Die Mangelhafte Geschlechtsempfindung des Weibes, pp. 19-26.

[102] In some parts of the world this is further aided by artificial means. Thus it is stated by Riedel (as quoted by Ploss and Bartels) that in the Gorong Archipelago the bridegroom, before the first coitus, anoints the bride's pudenda with an ointment containing opium, musk, etc. I have been told of an English bride who was instructed by her mother to use a candle for the same purpose.

[103] Parthenologia, pp. 302, et seq.

[104] The connection of this mucous flow with sexual emotion was discussed

early in the eighteenth century by Schurig in his
Gynæcologia, pp. 8-11;
it is frequently passed over by more modern writers.

[105] The drawing is reproduced by Ploss and Bartels,
Das Weib, vol. i,
Chapter XVII; many facts bearing on the ethnography of
coitus are brought
together in this chapter.

[106] Onanoff (Paris Société de Biologie, May 3, 1890)
proposed the name
of bulbo-cavernous reflex for the smart contraction of
the ischio-and
bulbo-cavernosus muscles (erector penis and accelerator
urinæ) produced by
mechanical excitation of the glans. This reflex is
clinically elicited by
placing the index-finger of the left hand on the region
of the bulb while
the right hand rapidly rubs the dorsal surface of the
glands with the edge
of a piece of paper or lightly pinches the mucous
membrane; a twitching of
the region of the bulb is then perceived. This reflex is
always present in
healthy adult subjects and indicates the integrity of
the physical
mechanism of detumescence. It has been described by
Hughes. (C.H. Hughes,
"The Virile or Bulbo-cavernous Reflex," _Alienist and
Neurologist_,
January, 1898.)

[108] _Das Weib_, seventh edition, vol. i, p. 510.

[109] The influence of impeded respiration in exciting
more or less
perverted forms of sexual gratification has been
discussed in a section of
"Love and Pain" in the third volume of these _Studies_.

[110] See, e.g., the experiments of Obici on this point,

Revista
Sperimentale di Freniatria, 1903, pp. 689, et seq.

[111] Summarized in Archives d'Anthropologie Criminelle, March, 1903, p. 188. The tendency to closure of the eyes noted by Roubaud, to avoid contact of the light, indicates dilatation of the pupils, for which we need not seek other explanation than the general tendency of all peripheral stimulation, according to Schiff's law, to produce such dilatation.

[112] Vaschide and Vurpas, "Du Coefficient Sexuel de l'Impulsion Musicale," Archives de Neurologie, May, 1904.

[113] In the Priapeia is an inscription which has thus been translated:--

"You see this organ, after which I'm called
And which is my certificate, is humid;
This moisture is not dew nor drops of rain,
It is the outcome of sweet memory,
Recalling thoughts of a complacent maid."

The translator supposes that semen is referred to, but without doubt the allusion is to the theologians' distillatio.

[114] A woman of 30, normal and intelligent, after conversing on love and passion, and then listening to the music of Grieg and Schumann, felt real and strong sexual excitement, increased by memories recalled by the presence of a sympathetic person. When then tested by the dynamometer the average of ten efforts with the right hand was found to be 28.2 (her normal average being 31.1) and with the left hand 28.0 (the normal being

30.0). There was, however, great variability in the individual pressures which sometimes equaled and even exceeded the subject's normal efforts.

The voluntary muscles are thus in harmony with the approaching general sexual avalanche. (Vaschide and Vurpas, "Quelques Données Expérimentales sur l'Influence de l'Excitation Sexuelle," *Archivio di Psichiatria*, 1903, fasc. v-vi.)

[123] This is an instinctive impulse under all strong emotion in primitive persons. "The Australian Dieri," says A.W. Howitt (*_Journal Anthropological Institute_*, August, 1890), "when in pain or grief cry out for their father or mother."

[124] Vaschide and Vurpas, *_Archives de Neurologie_*, May, 1904.

[125] F.B. Robinson, *_New York Medical Journal_*, March 11, 1893.

[126] Féré deals fully with the various morbid results which may follow coitus, *_L' Instinct Sexuel_*, Chapter X; id., *_Pathologie des Emotions_*, p. 99.

[127] With regard to the relationship of detumescence to the blood-pressure Haig remarks: "I think that as the sexual act produces low and falling blood-pressure, it will of necessity relieve conditions which are due to high and rising blood-pressure, such, for instance, as mental depression and bad temper; and, unless my observation deceives me, we have here a connection between conditions of high blood-pressure, with mental and bodily depression, and the act of masturbation, for this act will relieve those conditions, and will tend to be practiced for this purpose."
(A. Haig, *_Uric Acid_*, sixth edition, p. 154.)

[128] A medical correspondent speaks of subjective feelings of temperature coming over the body from 20 to 24 hours after congress,

and marked by sensations of cooling of body and glow of cheeks. In another case, though lassitude appears on the second day after congress, the first day after is marked by a notable increase in mental and physical activity.

III.

The Constituents of Semen--Function of the Prostate--The Properties of Semen--Aphrodisiacs--Alcohol, Opium, etc.--Anaphrodisiacs--The Stimulant Influence of Semen in Coitus--The Internal Effects of Testicular Secretions--The Influence of Ovarian Secretion.

The germ cell never comes into the sphere of consciousness and cannot therefore concern us in the psychological study of the phenomena of the sexual instinct. But it is otherwise with the sperm cell, and the seminal fluid has a relationship, both direct and indirect, to psychic phenomena which it is now necessary to discuss.

While the spermatozoa are formed in the glandular tissue of the testes, the seminal fluid as finally emitted in detumescence is not a purely testicular product, but is formed by mixture with the fluids poured out at or before detumescence by various glands which open into the urethra, and notably the prostate.[129] This is a purely sexual gland, which in animals only becomes large and active during the breeding season, and may even be hardly distinguishable at other times; moreover, if the

testes are removed in infancy, the prostate remains rudimentary, so that during recent years removal of the testes has been widely advocated and practiced for that hypertrophy of the prostate which is sometimes a distressing ailment of old age. It is the prostatic fluid, according to Fürbringer, which imparts its characteristic odor to semen. It appears, however, to be the main function of the prostatic fluid to arouse and maintain the motility of the spermatozoa; before meeting the prostatic fluid the spermatozoa are motionless; that fluid seems to furnish a thinner medium in which they for the first time gain their full vitality.[130]

When at length the semen is ejaculated, it contains various substances which may be separated from it,[131] and possesses various qualities, some of which have only lately been investigated, while others have evidently been known to mankind from a very early period. "When held for some time in the mouth," remarked John Hunter, "it produces a warmth similar to spices, which lasts some time." [132] Possibly this fact first suggested that semen might, when ingested, possess valuable stimulant qualities, a discovery which has been made by various savages, notably by the Australian aborigines, who, in many parts of Australia, administer a potion of semen to dying or feeble members of the tribe.[133] It is perhaps noteworthy that in Central Africa the testes of the goat are consumed as an aphrodisiac.[134] In eighteenth century Europe, Schurig, in his *Spermatologia*, still found it necessary to discuss at considerable

length the possible medical properties of human semen, giving many prescriptions which contained it.[135] The stimulation produced by the ingestion of semen would appear to form in some cases a part of the attraction exerted by _fellatio_; De Sade emphasized this point; and in a case recorded by Howard semen appears to have acted as a stimulant for which the craving was as irresistible as is that for alcohol in dipsomania.[136]

It must be remembered that the early history of this subject is more or less inextricably commingled with folk-lore practices of magical origin, not necessarily founded on actual observation of the physiological effects of consuming the semen or testes. Thus, according to W.H. Pearse (_Scalpel_, December, 1897), it is the custom in Cornwall for country maids to eat the testicles of the young male lambs when they are castrated in the spring, the survival, probably, of a very ancient religious cult. (I have not myself been able to hear of this custom in Cornwall.) In Burchard's Penitential (Cap. CLIV, Wasserschleben, op. cit., p. 660) seven years' penance is assigned to the woman who swallows her husband's semen to make him love her more. In the seventeenth century (as shown in William Salmon's _London Dispensatory_, 1678) semen was still considered to be good against witchcraft and also valuable as a love-philter, in which latter capacity its use still survives. (Bourke, _Scatalogic Rites_, pp.

343, 355.)

In an earlier age (Picart, quoted by Crawley, *The Mystic Rose*, p. 109) the Manichæans, it is said, sprinkled their eucharistic bread with human semen, a custom followed by the Albigenses.

The belief, perhaps founded in experience, that semen possesses medical and stimulant virtues was doubtless fortified by the ancient opinion that the spinal cord is the source of this fluid.

This was not only held by the highest medical authorities in Greece, but also in India and Persia.

The semen is thus a natural stimulant, a physiological aphrodisiac, the type of a class of drugs which have been known and cultivated in all parts of the world from time immemorial.

(Dufour has discussed the aphrodisiacs used in ancient Rome, *Histoire de la Prostitution*, vol. II, ch. 21.) It would be vain to attempt to enumerate all the foods and medicaments to which has been ascribed an influence in heightening the sexual impulse.

(Thus, in the sixteenth century, aphrodisiacal virtues were attributed to an immense variety of foods by Liébault in his *Thresor des Remèdes Secrets pour les Maladies des Femmes*, 1585, pp. 104, et seq.) A large number of them certainly have no such effect at all, but have obtained this credit either on some magical ground or from a mistaken association. Thus the potato, when first introduced from America, had the

reputation of being a powerful aphrodisiac, and the Elizabethan dramatists contain many references to this supposed virtue. As we know, potatoes, even when taken in the largest doses, have not the slightest aphrodisiac effect, and the Irish peasantry, whose diet consists very largely of potatoes, are even regarded as possessing an unusually small measure of sexual feeling. It is probable that the mistake arose from the fact that potatoes were originally a luxury, and luxuries frequently tend to be regarded as aphrodisiacs, since they are consumed under circumstances which tend to arouse the sexual desires. It is possible also that, as has been plausibly suggested, the misunderstanding may have been due to sailors--the first to be familiar with the potato--who attributed to this particular element of their diet ashore the generally stimulating qualities of their life in port. The eryngo (*Eryngium maritimum*), or sea holly, which also had an erotic reputation in Elizabethan times, may well have acquired it in the same way. Many other vegetables have a similar reputation, which they still retain. Thus onions are regarded as aphrodisiacal, and were so regarded by the Greeks, as we learn from Aristophanes. It is noteworthy that Marro, a reliable observer, has found that in Italy, both in prisons and asylums, lascivious people are fond of onions (*La Pubertà*, p. 297), and it may perhaps be worth while

to recall the observation of Sérioux that in a woman in whom the sexual instinct only awoke in middle age there was a horror of leeks. In some countries, and especially in Belgium, celery is popularly looked upon as a sexual stimulant. Various condiments, again, have the same reputation, perhaps because they are hot and because sexual desire is regarded, rightly enough, as a kind of heat. Fish--skate, for instance, and notably oysters and other shellfish--are very widely regarded as aphrodisiacs, and Kisch attributes this property to caviar. It is probable that all these and other foods which have obtained this reputation, in so far as they have any action whatever on the sexual appetite, only possess it by virtue of their generally nutritious and stimulating qualities, and not by the presence of any special principle having a selective action on the sexual sphere. A beefsteak is probably as powerful a sexual stimulant as any food; a nutritious food, however, which is at the same time easily digestible, and thus requiring less expenditure of energy for its absorption, may well exert a specially rapid and conspicuous stimulant effect. But it is not possible to draw a line, and, as Aquinas long since said, if we wish to maintain ourselves in a state of purity we shall fear even an immoderate use of bread and water.

More definitely aphrodisiacal effects are produced

by drugs, and especially by drugs which in large doses are poisons. The aphrodisiac with the widest popular reputation is cantharides, but its sexually exciting effects are merely an accidental result of its action in causing inflammation of the genito-urinary passage, and it is both an uncertain and a dangerous result, except in skillful hands and when administered in small doses.

Nux vomica (with its alkaloid strychnia), by virtue of its special action on the spinal cord, has a notably pronounced effect in heightening the irritability of the spinal ejaculatory center, though it by no means necessarily exerts any strengthening influence. Alcohol exerts a sexually exciting effect, but in a different manner; it produces little stimulation of the cord and, indeed, even paralyzes the lumbar sexual center in large doses, but it has an influence on the peripheral nerve-endings and on the skin, and also on the cerebral centers, tending to arouse desire and to diminish inhibition. In this latter way, as Adler remarks, it may, in small doses, under some circumstances, be beneficial in men with an excessive nervousness or dread of coitus, and women, in whom orgasm has been difficult to reach, have frequently found this facilitated by some previous indulgence in alcohol. The aphrodisiac effect of alcohol seems specially marked on women. But against the use of alcohol as an aphrodisiac it must be remembered that

it is far
from being a tonic to detumescence, at all events in
men, and
that there is much evidence tending to show that not
only chronic
alcoholism, but even procreation during intoxication
is perilous
to the offspring (see, e.g., Andriezen, Journal of
Mental
Science, January, 1905, and cf. W.C. Sullivan,
"Alcoholism and
Suicidal Impulses," *ib.*, April, 1898, p. 268); it
may be added
that Bunge has found a very high proportion of cases
of
immoderate use of alcohol in the fathers of women
unable to
suckle their infants (G. von Bunge, Die Zunehmende
Unfähigkeit
der Frauen ihre Kinder zu Stillen, 1903) while even
an
approximation to the drunken state is far from being
a desirable
prelude to the creation of a new human being. It is
obvious that
those who wish, for any reason, to cultivate a
strict chastity of
thought and feeling would do well to avoid alcohol
altogether, or
only in its lightest forms and in moderation. The
aphrodisiacal
effects of wine have long been known; Ovid refers to
them (e.g.,
Ars Am., Bk. III, 765). Clement of Alexandria, who
was
something of a man of science as well as a Christian
moralist,
points out the influence of wine in producing
lasciviousness and
sexual precocity. (Pædagogus, Bk. II, Chapter II).
Chaucer
makes the Wife of Bath say in the Wife of Bath's
Prologue:--

"And, after wyn, on Venus moste [needs] I

thinke:

For al so siken as cold engendreth hayl,
A likerous mouth moste have a likerous tayl,
In womman vinolent is no defense,
This knowen lechours by experience."

Alcohol, as Chaucer pointed out, comes to the aid of the man, who is unscrupulous in his efforts to overcome a woman, and this not merely by virtue of its aphrodisiacal effects, and the apparently special influence which it seems to exert on women, but also because it lulls the mental and emotional characteristics which are the guardians of personality. A correspondent who has questioned on this point a number of prostitutes he has known, writes: "Their accounts of the first fall were nearly always the same. They got to know a 'gentleman,' and on one occasion they drank too much; before they quite realized what was happening they were no longer virgins." "In the mental areas, under the influence of alcohol," Schmiedeberg remarks (in his Elements of Pharmacology), "the finer degrees of observation, judgment, and reflection are the first to disappear, while the remaining mental functions remain in a normal condition. The soldier acts more boldly because he notices dangers less and reflects over them less; the orator does not allow himself to be influenced by any disturbing side-considerations as to his audience, hence he speaks more freely and spiritedly; self-consciousness is lost to a very great extent, and many are astounded at the

ease with

which they can express their thoughts, and at the acuteness of

their judgment in matters which, when they are perfectly sober,

with difficulty reach their minds; and then afterwards they are ashamed at their mistakes."

The action of opium in small doses is also to some extent

aphrodisiacal; it slightly stimulates both the brain and the

spinal cord, and has sensory effects on the skin like alcohol;

these effects are favored by the state of agreeable dreaminess it

produces. In the seventeenth century Venette (*La Génération de*

l'Homme, Part II, Chapter V) strongly recommended small doses of

opium, then little known, for this purpose; he had himself, he

says, in illness experienced its joys, "a shadow of those of

heaven." In India opium (as well as *cannabis indica*) has long

been a not uncommon aphrodisiac; it is specially used to diminish

local sensibility, delaying the orgasm and thus prolonging the

sexual act. (W.D. Sutherland, "De Impotentia," *Indian Medical*

Gazette, January, 1900). Its more direct and stimulating

influence on the sexual emotions seems indicated by the statement

that prostitutes are found standing outside the opium-smoking

dens of Bombay, but not outside the neighboring liquor shops.

(G.C. Lucas, *Lancet*, February 2, 1884.) Like alcohol, opium

seems to have a marked aphrodisiacal effect on women. The case is

recorded of a mentally deranged girl, with no nymphomania though she masturbated, who on taking small doses of opium at once showed signs of nymphomania, following men about, etc. (American Journal Obstetrics, May, 1901, p. 74.) It may well be believed that opium acts beneficially in men when the ejaculatory centers are weak but irritable; but its actions are too widespread over the organism to make it in any degree a valuable aphrodisiac.

Various other drugs have more or less reputation as aphrodisiacs; thus bromide of gold, a nervous and glandular stimulant, is said to have as one of its effects a heightening of sexual feeling.

Yohimbin, an alkaloid derived from the West African Yohimbehe tree, has obtained considerable repute during recent years in the treatment of impotence; in some cases (see, e.g., Toff's results, summarized in British Medical Journal, February 18, 1905) it has produced good results, apparently by increasing the blood supply to the sexual organs, but has not been successful in all cases or in all hands. It must always be remembered that in cases of psychical impotence suggestion necessarily exerts a beneficial influence, and this may work through any drug or merely with the aid of bread pills. All exercise, often even walking, may be a sexual stimulant, and it is scarcely necessary to add that powerful stimulation of the skin in the sexual sphere, and more especially of the nates, is often a more effective

aphrodisiac

than any drug, whether the irritation is purely mechanical, as by flogging, or mechanico-chemical, as by urtication or the

application of nettles. Among the Malays (with whom both men and women often use a variety of plants as aphrodisiacs, according to

Vaughan Stevens) Breitenstein states (*_21 Jahre in India_, Theil I, p. 228*) that both massage and gymnastics are used to increase

sexual powers. The local application of electricity is one of the most powerful of aphrodisiacs, and McMordie found on applying one

pole to a uterine sound in the uterus and the other to the abdominal wall that in the majority of healthy women the orgasm occurred.

Among anaphrodisiacs, or sexual sedatives, bromide of potassium,

by virtue of its antidotal relationship to strychnia, is one of

the drugs whose action is most definite, though, while it dulls

sexual desire, it also dulls all the nervous and cerebral

activities. Camphor has an ancient reputation as an anaphrodisiac, and its use in this respect was known to the Arabs

(as may be seen by a reference to it in the *_Perfumed Garden_*),

while, as Hyrtl mentions (*loc. cit. ii, p. 94*), rue (*_Ruta*

graveolens_) was considered a sexual sedative by the monks of

old, who on this account assiduously cultivated it in their

cloister gardens to make *_vinum rutæ_*. Recently heroin in large

doses (see, e.g., Becker, *_Berliner Klinische*

Wochenschrift_,

November 23, 1903) has been found to have a useful effect in this

direction. It may be doubted, however, whether there is any

satisfactory and reliable anaphrodisiac. Charcot, indeed, it is

said, used to declare that the only anaphrodisiac in which he had

any confidence was that used by the uncle of Heloïse in the case

of Abelard. "_Cela_ (he would add with a grim smile) _tranche la
difficulte_."

If semen is a stimulant when ingested, it is easy to suppose that it may exert a similar action on the woman who receives it into the vagina in

normal sexual congress. It is by no means improbable that, as Mattei

argued in 1878, this is actually the case. It is known that the vagina

possesses considerable absorptive power. Thus Coen and Levi, among others,

have shown that if a tampon soaked in a solution of iodine is introduced

into the vagina, iodine will be found in the urine within an hour. And the

same is true of various other substances.[137] If the vagina absorbs drugs

it probably absorbs semen. Toff, of Braila (Roumania), who attaches much

importance to such absorption, considers that it must be analogous to the

ingestion of organic extractives. It is due to this influence, he

believes, that weak and anæmic girls so often become full-blooded and

robust after marriage, and lose their nervous tendencies and shyness.[138]

It is, however, most certainly a mistake to suppose that the beneficial

influence of coitus on women is exclusively, or even

mainly, dependent upon the absorption of semen. This is conclusively demonstrated by the fact that such beneficial influence is exerted, and in full measure, even when all precautions have been taken to avoid any contact with the semen. In so far as coitus reservatus or interruptus may lead to haste or discomfort which prevents satisfactory orgasm on the part of the woman, it is without doubt a cause of defective detumescence and incomplete satisfaction. But if orgasm is complete the beneficial effects of coitus follow even if there has been no possibility of the absorption of semen. Even after coitus interruptus, if it can be prolonged for a period long enough for the woman to attain full and complete satisfaction, she is enabled to experience what she may describe as a feeling of intoxication, lasting for several hours. It is in the action of the orgasm itself, and the vascular, secretory, and metabolic activities set up by the psychic and nervous influence of coitus with a beloved person, that we must seek the chief key to the effects produced by coitus on women, however these effects may possibly be still further heightened by the actual absorption of semen.[139]

The positive action of semen, or rather of the testicular products, has been much investigated during recent years, and appears on the whole to be demonstrated. The notable discovery by Brown-Séguard, a quarter of a century ago, that the ingestion of the testicular juices in states of debility and senility acted as a beneficial stimulant and tonic, opened

the way to a new field of therapeutics. Many investigators in various countries have found that testicular extracts, and more especially the spermin as studied by Poehl,[140] and by him regarded as a positive katalysator or accelerator of metabolic processes, exert a real influence in giving tone to the heart and other muscles, and in improving the metabolism of the tissues even when all influences of mental suggestion have been excluded.[141]

As the ovaries are strictly analogous to the testes, it was surmised that ovarian extract might prove a drug equally valuable with testicular products. As a matter of fact, ovarian extract, in the form of ovarin, etc., would seem to have proved beneficial in various disorders, more especially in anæmia and in troubles due to the artificial menopause. In most conditions, however, in which it has been employed the results are doubtful or uncertain, and some authorities believe that the influence of suggestion plays a considerable part here.

There is, however, another use which is subserved by the testicular products, a use which may indeed be said to be implied in those uses to which reference has already been made, but is yet historically the latest to be realized and studied. It was not until 1869 that Brown-Séguard first suggested that an important secretion was elaborated by the ductless glands and received into the circulation, but that suggestion proved to be epoch-making. If these glandular secretions are so

valuable when administered as drugs to other persons, must they not be of far greater value when naturally secreted and poured out into the circulation in the living body? It is now generally believed, on the basis of a large and various body of evidence, that this is undoubtedly so. In a very crude form, indeed, this belief is by no means modern. In opposition to the old writers who were inclined to regard the semen as an excretion which it was beneficial to expel, there were other ancient authorities who argued that it was beneficial to retain it as being a vital fluid which, if reabsorbed, served to invigorate the body. The great physiologist, Haller, in the middle of the eighteenth century, came very near to the modern doctrine when he stated in his Elements of Physiology that the sperm accumulated in the seminal vesicles is pumped back into the blood, and thus produces the beard and the hair together with the other surprising changes of puberty which are absent in the eunuch. The reabsorption of semen can scarcely be said to be a part of the modern physiological doctrine, but it is at least now generally held that the testes secrete substances which pass into the circulation and are of immense importance in the development of the organism.

The experiments of Shattock and Seligmann indicate that the semen and its reabsorption in the seminal vesicles, or the nervous reactions produced by its presence, can have no part in the formation of secondary sexual characters. These investigators occluded the vas deferens in sheep by

ligature, at an early age, rendering them later sterile though not impotent. The secondary sexual characters appeared as in ordinary sheep. Spermatogenesis, these inquirers conclude, may be the initial factor, but the results must be attributed to the elaboration by the testicles of an internal secretion and its absorption into the general circulation.[142]

When animals are castrated there is enlargement of the ductless glands in the body, notably the thyroid and the suprarenal capsules.[143] It is evident, therefore, that the secretions of these ductless glands are in some degree compensatory to those of the testes. But this compensatory action is inadequate to produce any sexual development in the absence of the testes.

We see, therefore, how extremely important is the function of the testis. Its significance is not alone for the race, it is not simply concerned with the formation of the spermatozoa which share equally with the ova the honor of making the mankind of the future. It also has a separate and distinct function which has reference to the individual. It elaborates those internal secretions which stimulate and maintain the physical and mental characters, constituting all that is most masculine in the male animal, all that makes the man in distinction from the eunuch. Among various primitive peoples, including those of the European race whence we ourselves spring, the most solemn form of oath was sworn by placing the hand on the testes, dimly recognized as the most sacred part of the body.

A crude and passing phase of civilization has ignorantly cast ignominy upon the sexual organs; the more primitive belief is now justified by our advancing knowledge.

In these as in other respects the ovaries are precisely analogous to the testes. They not only form the ova, but they elaborate for internal use a secretion which develops and maintains the special physical and mental qualities of womanhood, as the testicular secretion those of manhood. Moreover, as Cecca and Zappi found, removal of the ovaries has exactly the same effect on the abnormal development of the other ductless glands as has removal of the testes. It is of interest to point out that the internal secretion of the ovaries and its important functions seem to have been suggested before any other secretion than the sperm was attributed to the testes. Early in the nineteenth century Cabanis argued ("De l'Influence des Sexes sur le Caractère des Idées et des Affections Morales," *_Rapport du Physique et du Moral de l'Homme_*, 1824, vol. ii, p. 18) that the ovaries are secreting glands, forming a "particular humor" which is reabsorbed into the blood and imparts excitations which are felt by the whole system and all its organs.

FOOTNOTES:

[129] The composite character of the semen was recognized by various old

authors, some of whom said, (e.g., Wharton) that it had three constituents, which they usually considered to be: (1) The noblest and most essential part, from the testicles; (2) a watery element from the vesiculæ; (3) an oily element from the prostate. Schurig, *Spermatologia*, 1720, p. 17.

[130] See, e.g., C. Mansell Moulin, "A Contribution to the Morphology of the Prostate," *Journal of Anatomy and Physiology*, January, 1895; G. Walker, "A Contribution to the Anatomy and Physiology of the Prostate Gland, and a Few Observations on Ejaculation," *Johns Hopkins Hospital Bulletin*, October, 1900.

[131] For a study of the semen and its constituents, see Florence, "Du Sperme," *Archives d'Anthropologie Criminelle*, 1895.

April, 1903. In a similar but somewhat more precise manner Dufougère has argued ("La Chlorose, ses rapports avec le mariage, son traitement par le liquide orchitique," Thèse de Bordeaux, 1902) that semen when absorbed by the vagina stimulates the secretion of the ovaries and thus exerts an influence over the blood in anæmia; in this way he seeks to explain why it is that coitus is the best treatment for chlorosis.

[139] In this connection I may refer to an interesting and suggestive paper by Harry Campbell on "The Craving for Stimulants" (Lancet, October 21, 1899). No reference is made to coitus, but the author discusses stimulants as normal and beneficial products of the organism, and deals with the nature of the "physiological intoxication" they produce.

[140] Spermin was first discovered in the sperm by Schreiner in 1878; it has also been found in the thyroid, ovaries and various other glands. "The spermin secreting and elaborating organs," Howard Kelly remarks (British Medical Journal, January 29, 1898), "may be called the apothecaries' of the body, secreting many important medicaments, much more active and more accurately representing its true wants than artificially administered drugs."

IV.

The Aptitude for Detumescence--Is There an Erotic
Temperament?--The
Available Standards of Comparison--Characteristics of
the
Castrated--Characteristics of Puberty--Characteristics
of the State of
Detumescence--Shortness of Stature--Development of the
Secondary Sexual
Characters--Deep Voice--Bright Eyes--Glandular Activity--
-Everted
Lips--Pigmentation--Profuse Hair--Dubious Significance
of Many of These
Characters.

What, if any, are the indications which the body
generally may furnish as
to the individual's aptitude and vigor for the orgasm of
detumescence? Is
there an erotic temperament outwardly and visibly
displayed? That is a
question which has often occupied those who have sought
to penetrate the
more intimate mysteries of human nature, and since we
are here concerned
with human beings in their relationship to the process
of detumescence, we
cannot altogether pass over this question, difficult as
it is to discuss
it with precision.

The old physiognomists showed much confidence in dealing with the matter. Possibly they had more opportunities for observation than we have, since they often wrote in days when life was lived more nakedly than among ourselves, but their descriptions, while sometimes showing much insight, are inextricably mixed up with false science and superstition.

In the *_De Secretis Mulierum_*, wrongly attributed to Albertus Magnus, we find a chapter entitled "Signa mulieris calidæ naturæ et quæ coit libenter," which may be summarized here. "The signs," we are told, "of a woman of warm temperament, and one who willingly cohabits are these: youth, an age of over 12, or younger, if she has been seduced, small, high breasts, full and hard, hair in the usual positions; she is bold of speech, with a delicate and high voice, haughty and even cruel of disposition, of good complexion, lean rather than stout, inclined to like drinking. Such a woman always desires coitus, and receives satisfaction in the act. The menstrual flow is not abundant nor always regular. If she becomes pregnant the milk is not abundant. Her perspiration is less odorous than that of the woman of opposite temperament; she is fond of singing, and of moving about, and delights in adornments if she has any."

Polemon, in his *_Sulla Physionomia_*, has given among the signs of libidinous impulse: knees turned inwards, abundance

of hairs on
the legs, squint, bright eyes, a high and strident
voice, and in
women length of leg below the knee. Aristotle had
mentioned among
the signs of wantonness: paleness, abundance of hair
on the body,
thick and black hair, hairs covering the temples,
and thick
eyelids.

In the seventeenth century Bouchet, in his Serées
(Troisième
Serée), gave as the signs of virility which
indicated that a man
could have children: a great voice, a thick rough
black beard, a
large thick nose.

G. Tourdes (Art. "Aphrodisie," Dictionnaire
Encyclopédique des
Sciences Médicales) thus summarized the ancient
beliefs on this
subject: "The erotic temperament has been described
as marked by
a lean figure, white and well-ranged teeth, a
developed hairy
system, a characteristic voice, air, and expression,
and even a
special odor."

In approaching the question of the general physical
indications of a
special aptitude to the manifestation of vigorous
detumescence, the most
obvious preliminary would seem to be a study of the
castrated. If we know
the special peculiarities of those who by removal of the
sexual glands at
a very early age have been deprived of all ability to
present the
manifestations of detumescence, we shall probably be in
possession of a
type which is the reverse of that which we may expect in
persons of a

vigorously erotic temperament.

The most general characteristics of eunuchs would appear to be an unusual tendency to put on fat, a notably greater length of the legs, absence of hair in the sexual and secondary sexual regions, a less degree of pigmentation, as noted both in the castrated negro and the white man, a puerile larynx and puerile voice. In character they are usually described as gentle, conciliatory, and charitable.

There can be little doubt that castration in man tends to lead to lengthening of the legs (tibia and fibula) at puberty, from delayed ossification of the epiphyses. The hands and feet are also frequently longer and sometimes the forearms. At the same time the bones are more slender. The pelvis also is narrower. The eunuchs of Cairo are said to be easily seen in a crowd from their tall stature. (Collineau, quoting Lortet, *_Revue Mensuelle de l'Ecole d'Anthropologie_*, May, 1896.) The castrated Skoptzy show increased stature, and, it seems, large ears, with decreased chest and head (L. Pittard, *_Revue Scientifique_*, June 20, 1903.) Féré shows that in most of these respects the eunuch resembles beardless and infantile subjects. ("Les Proportions des Membres et les Caractères Sexuels," *_Journal de l'Anatomie et de la Physiologie_*, November-December, 1897.) Similar phenomena are found in animals generally. Sellheim, carefully investigating castrated horses, swine, oxen and fowls, found

retardation of
ossification, long and slender extremities, long,
broad, but low
skull, relatively smaller pelvis and small thorax.
("Zur Lehre
von den Sekundären Geschlechtscharakteren,"
_Beiträge zur
Geburtshilfe und Gynäkologie_, 1898, summarized in
_Centralblatt
für Anthropologie_, 1900, Heft IV.)

As regards the mental qualities and moral character
of the
castrated, Griffiths considers that there is an
undue prejudice
against eunuchs, and refers to Narses, who was not
only one of
the first generals of the Roman Empire, but a man of
highly
estimable character. (_Lancet_, March 30, 1895.)
Matignon, who
has carefully studied Chinese eunuchs, points out
that they
occupy positions of much responsibility, and, though
regarded in
many respects as social outcasts, possess very
excellent and
amiable moral qualities (_Archives Cliniques de
Bordeaux_, May,
1896.) In America Everett Flood finds that
epileptics and
feeble-minded boys are mentally and morally
benefited by
castration. ("Notes on the Castration of Idiot
Children,"
American Journal of Psychology, January, 1899.) It
is often
forgotten that the physical and psychic qualities
associated with
and largely dependent on the ability to experience
the impulse of
detumescence, while essential to the perfect man,
involve many
egoistic, aggressive and acquisitive characteristics
which are of

little intellectual value, and at the same time inimical to many moral virtues.

We have a further standard--positive this time rather than negative--to aid us in determining the erotic temperament: the phenomena of puberty. The efflorescence of puberty is essentially the manifestation of the ability to experience detumescence. It is therefore reasonable to suppose that the individuals in whom the special phenomena of puberty develop most markedly are those in whom detumescence is likely to be most vigorous. If such is the case we should expect to find the erotic temperament marked by developed larynx and deep voice, a considerable degree of pigmentary development in hair and skin, and a marked tendency to hairiness; while in women there should be a pronounced growth of the breasts and pelvis.[144]

There is yet another standard by which we may measure the individual's aptitude for detumescence: the presence of those activities which are most prominently brought into play during the process of detumescence. The individual, that is to say, who is organically most apt to manifest the physiological activities which mainly make up the process of detumescence, is most likely to be of pronounced erotic temperament.

"Erotic persons are of motor type," remark Vaschide and Vurpas, "and we may say generally that nearly all persons of motor type are erotic." The state of detumescence is one of motor and muscular energy and of great vascular activity, so that habitual energy of motor

response and an active circulation may reasonably be taken to indicate an aptitude for the manifestation of detumescence.

These three types may be said, therefore, to furnish us valuable though somewhat general indications. The individual who is farthest removed from the castrated type, who presents in fullest degree the characters which begin to emerge at the period of puberty, and who reveals a physiological aptitude for the vigorous manifestation of those activities which are called into action during detumescence, is most likely to be of erotic temperament. The most cautious description of the characteristics of this temperament given by modern scientific writers, unlike the more detailed and hazardous descriptions of the early physiognomists, will be found to be fairly true to the standards thus presented to us.

The man of sexual type, according to Biérent (*La Puberté*, p. 148), is hairy, dark and deep-voiced.

"The men most liable to satyriasis," Bouchereau states (art.

"Satyriasis," *Dictionnaire Encyclopédique des Sciences*

Médicales), "are those with vigorous nervous system, developed

muscles, abundant hair on body, dark complexion, and white teeth."

Mantegazza, in his *Fisiologia del Piacere*, thus describes the

sexual temperament: "Individuals of nervous temperament, those

with fine and brown skins, rounded forms, large lips and very

prominent larynx enjoy in general much more than those with opposite characteristics. A universal tradition," he adds, "describes as lascivious humpbacks, dwarfs, and in general persons of short stature and with long noses."

In a case of nymphomania in a young woman, described by Alibert (and quoted by Laycock, *Nervous Diseases of Women*, p. 28) the hips, thighs and legs were remarkably plump, while the chest and arms were completely emaciated. In a somewhat similar case described by Marc in his *De la Folie* a peasant woman, who from an early age had experienced sexual hyperæsthesia, so that she felt spasmodic voluptuous feelings at the sight of a man, and was thus the victim of solitary excesses and of spasmodic movements which she could not repress, the upper part of the body was very thin, the hips, legs and thighs highly developed.

In his work on *Uterine and Ovarian Inflammation* (1862, p. 37) Tilt observes: "The restless, bashful eye, and changing complexion, in presence of a person of the opposite sex, and a nervous restlessness of body, ever on the move, turning and twisting on sofa or chair, are the best indications of sexual temperament."

An extremely sensual little girl of 8, who was constantly masturbating when not watched, although brought up by nuns, was described by Busdraghi (*Archivio di Psichiatria*,

fas. i, 1888,

p. 53) as having chestnut hair, bright black eyes, an elevated nose, small mouth, pleasant round face, full colored cheeks, and plump and healthy aspect.

A highly intelligent young Italian woman with strong and somewhat

perverted sexual impulses is described as of attractive

appearance, with olive complexion, small black almond-shaped

eyes, dilated pupils, oblique thin eyebrows, very thick black

hair, rather prominent cheek-bones, largely developed jaw, and

with abundant down on lower part of cheeks and on upper lip.

(Archivio di Psichiatria, 1899, fasc. v-vi.)

As the type of the sensual woman in word and act, led by her

passions to commit various sexual offenses, Ottolenghi describes

(Archivio di Psichiatria, vol. xii, fasc. v-vi, p. 496) a woman

of 32 who attempted to kill her lover. The daughter of parents

who were neurotic and themselves very erotic, she was a highly

intelligent and vivacious woman, with a pleasing and open face,

very thick dark chestnut hair, large cheek-bones, adipose

buttocks almost resembling those of a Hottentot, and very thick

pubic hair. She was very fond of salt things. Sexual inclination

began at the age of 7.

Adler and Moll remark, very truly, that, so far at least as women are

concerned, sexual anæsthesia or sexual proclivity cannot be unfailingly

read on the features. Every woman desires to please, and coquetry is the sign of a cold, rather than of an erotic temperament.[145] It may be added that a considerable degree of congenital sexual anæsthesia by no means prevents a woman from being beautiful and attractive, though it must probably still always be said that, as Roubaud points out,[146] the woman of cold and intellectual temperament, the "femme de tête," however beautiful and skillful she may be, cannot compete in the struggle for love with the woman whose qualities are of the heart and of the emotions. But it seems sufficiently clear that the practical observations of skilled and experienced observers agree in attributing to persons of erotic type certain general characteristics which accord with those negative and positive standards we may frame on the basis of castration, of puberty, and of detumescence. It may be worth while to note a few of these characteristics briefly.

The abnormal lengthening of the long bones at the age of puberty in the castrated is, as we have seen, very pronounced. There is little tendency to associate length of limb with an erotic temperament, and a certain amount of data as well as of more vague opinion points in the opposite direction. The Arabs would appear to believe that it is short rather than tall people in whom the sexual instinct is strongly developed, and we read in the Perfumed Garden: "Under all circumstances little women love coitus more and evince a stronger affection for the virile member than women of a large size." In his elaborate investigation

of criminals Marro found that prostitutes and women guilty of sexual offenses, as also male sexual offenders, tend to be short and thick set.[147] In European folk-lore the thick, bull neck is regarded as a sign of strong sexuality.[148] Mantegazza refers to a strong sexual temperament as being associated with arrest or disorder of bony development, and Marro suggests that the proverbial salacity of rachitic individuals may be due to an increased activity of the sexual organs.[149] It may be added that acromegaly, with its excessive bony growths, tends to be associated with premature sexual involution.

A further point which is frequently mentioned in the case of women is the development of the chief secondary sexual regions: the pelvis and the breasts. It is, indeed, almost inevitable that there should be some degree of correlation between the aptitude for bearing children and the aptitude for experiencing detumescence. The reality of such a connection is not only evidenced by medical observations, but receives further testimony in popular beliefs. In Italy women with large buttocks are considered wanton, and among the South Slavs they are regarded as especially fruitful.[150] Blumenbach asserted that precocious venery will enlarge the breasts, and believed that he had found evidence of this among young London prostitutes.[151]

The association of the aptitude for detumescence with a tendency to a deep rather than to a high voice, both in men and women, has frequently been

noted and has seldom been denied. The onset of puberty always affects the voice; in general, Biérent states, the more bass the voice is the more marked is the development of the sexual apparatus; "a very robust man, with very developed sexual organs, and very dark and abundant hairy system, a man of strong puberty in a word, is nearly always a bass." [152]

The influence of sexual excitement in deepening the voice is shown by the rules of sexual hygiene prescribed to tenors, while a bass has less need to observe similar precautions. In women every phase of sexual life--puberty, menstruation, coitus, pregnancy--tends to affect the voice and always by giving it a deeper character. The deepening of the voice by sexual intercourse was an ancient Greek observation, and Martial refers to a woman's good or bad singing as an index to her recent sexual habits. Prostitutes tend to have a deep voice. Venturi points out that married women preserve a fresh voice to a more advanced age than spinsters, this being due to the precocious senility in the latter of an unused function. Such a phenomenon indicates that the relationship of detumescence to the deepening of the voice is not quite simple. This is further indicated by the fact that in robust men abstinence still further deepens the voice (the monk of melodrama always has a bass voice), while excessive or precocious sexual indulgence tends to be associated with the same kind of puerile voice as is found in those persons in whom pubertal development has not been carried very far, or who are of what Griffiths terms eunuchoid type. Idiot boys, who are often sexually

undeveloped, tend to have a high voice, while idiot girls (who often manifest marked sexual proclivities) not infrequently have a deep voice.[153]

Bright dilated eyes are among the phenomena of detumescence, and are very frequently noted in persons of a pronounced erotic temperament. This is, indeed, an ancient observation, and Burton says of people with a black, lively, and sparkling eye, "without question they are most amorous," drawing his illustrations mostly from classic literature.[154] Tardieu described the erotic woman as having bright eyes, and Heywood Smith states that the eyes of lascivious women resemble, though in a less degree, those of the insane.[155] Sexual excitement is one among many causes--intellectual excitement, pain, a loud noise, even any sensory irritation--which produce dilatation of the pupils and enlargement of the palpebral fissure, with some protrusion of the eyeball. The influence of the sexual system upon the eye appears to be far less potent in men than in women.[156] Sexual desire is, however, by no means the only irritant within the sexual sphere which may thus influence the eye; morbid irritations may produce the same effect. Milner Fothergill, in his book on Indigestion, vividly describes the appearance of the eyes sometimes seen in ovarian disorder: "The glittering flash which glances out from some female irides is the external indication of ovarian irritation, and 'the ovarian gleam' has features quite its own. The most marked instance which ever came under my notice was due to irritation in the ovaries, which had been forced down in front of the uterus and

been fixed there by adhesions. Here there was little sexual proclivity, but the eyes were very remarkable. They flashed and glittered unceasingly, and at times perfect lightning bolts shot from them. Usually there is a bright glittering sheen in them which contrasts with the dead look in the irides of sexual excess or profuse uterine discharges."

The activity of the glandular secretions, and especially those of the skin, during detumescence, would lead us to expect that such secretory activity is an index to an aptitude for detumescence. As a matter of fact it is occasionally, though not frequently, noted by medical observers. It is stated that the erotic temperament is characterized by a special odor.[157] The activity of the sweat-glands is seldom referred to by medical observers in describing persons of erotic temperament, although the descriptions of novelists not infrequently contain allusions to this point, and the literature of an earlier age shows that the tendency to perspiration, especially the moist hand, was regarded as a sure sign of a sensual temperament. "The moist-handed Madonna Imperia, a most rare and divine creature," remarks Lazarillo in Middleton's comedy *Blurt, Master-Constable*, to quote one of many allusions to this point in the Elizabethan drama.

The lips are sometimes noted as red and everted, perhaps thick[158]; Tardieu remarked that the typically erotic woman has thick red lips. This corresponds with the characteristic type of the satyr in classic statues

as in later paintings; his lips are always thick and everted. Fullness, redness, and eversion of the lips are correlated with good breathing, the absence of anæmia, laughter, a well-fleshed face.

This kind of mouth indicates, perhaps, not so much a congenitally erotic temperament, as an abandonment to impulse. The opposite type of mouth--with inverted, thin, and retracted lips--would appear to be found with especial frequency in persons who habitually repress their impulses on moral grounds. Any kind of effort to restrain involuntary muscular action may lead to retraction of the lips: the effort to overcome anger or fear, or even the resistance to a strong desire to urinate or defecate. In religious young men, however, it becomes habitual and fixed. I recall a small band of medical students, gathered together from a large medical school, who were accustomed to meet together for prayer and Bible-reading; the majority showed this type of mouth to a very marked degree: pale faces, with drawn, retracted lips. It may be termed the Christian or pious facies. It is much less frequently seen in religious women (unless of masculine type), doubtless because religion for women is in a much less degree than for men a moral discipline.

It may be added that an interesting form of this contraction of the lips, and one that is not purely repressive, is that which indicates the state of muscular tension associated

with the
impulse to guard and protect. In this form the
contracted mouth
is the index of tenderness, and is characteristic of
the mother
who is watching over the infant she is suckling at
her breast. I
have observed precisely the same expression in the
face of a boy
of 14 with a large congenital scrotal hernia; when
the tumor was
being examined his lower lip became retracted, well
marked lines
appearing from the angles downwards, though the
upper lip
retained its normal expression It was precisely the
tender look
we may see in the faces of mothers who are watching
anxiously
over their offspring, and the emotion is evidently
the same in
both cases: solicitude for a sensitive and tenderly
guarded
object.

The degree of pigmentation is clearly correlated with
sexual vigor. "In
general," Heusinger laid down, in 1823, "the quantity of
pigment is
proportional to the functional effectiveness of the
genital organs." This
connection is so profound that it may be traced very
widely throughout the
organic world.

The connection between pigmentation and sexual activity
is very ancient.
Even leaving out of account the wedding apparel of
animals, nearly always
gorgeous in scales and plumage and hair, the sexual
orifice shows a more
or less marked tendency to pigmentation during the
breeding season from
fishes upward, while in mammals the darker pigmentation
of this region is

a constant phenomenon in sexually mature individuals.[159]

In the human species both the negative standard of castration and the positive standard of puberty alike indicate a correlation of this kind. Those individuals in whom puberty never fully develops and who are consequently said to be affected by infantilism, reveal a relative absence of pigment in the sexual centers which are normally pigmented to a high degree.[160] Among those Asiatic races who extirpate the ovaries in young girls the skin remains white in the perineum, round the anus, and in the armpits.[161] Even in mature women who undergo ovariectomy, as Kepler found, the pigmentation of the nipples and areola disappears, as well as of the perineum and anus, the skin taking on a remarkable whiteness.

Normally the sexual centers, and in a high degree the genital orifice, represent the maximum of pigmentation, and under some circumstances this is clearly visible even in infancy. Thus babies of mixed black and white blood may show no traces of negro ancestry at birth, but there will always be increased pigmentation about the external genitalia.[162] The linea fusca, which reaches from the pubes to the navel and occasionally to the ensiform cartilage, is a line of sexual pigmentation sometimes regarded as characteristic of pregnancy, but as Andersen, of Copenhagen, has found by the examination of several hundred children of both sexes, it exists in a slight form in about 75 per cent. of young girls, and in almost as large a proportion of boys. But there is no doubt that it tends

to increase with age as well as to become marked at pregnancy. At puberty there is a general tendency to changes in pigmentation; thus Godin found that in 28 per cent, adolescent changes occurred in the eyes and hair at this period, the hair becoming darker, though the eyes sometimes become lighter. Ammon, in his investigation of conscripts at the age of 20 (post, p. 196), discovered the significant fact that the eyes and hair darken pari passu with sexual development. In women, during menstruation, there is a general tendency to pigmentation; this is especially obvious around the eyes, and in some cases black rings of true pigment form in this position. Even the skin of the negro women of Loango sometimes becomes a few shades darker during menstruation.[163] During pregnancy this tendency to pigmentation reaches its climax. Pregnancy constantly gives rise to pigmentation of the face, the neck, the nipples, the abdomen, and this is especially marked in brunettes.

This association of pigmentation and sexual aptitudes has been recognized in the popular lore of some peoples. Thus the Sicilians, who admire brown skin and have no liking either for a fair skin or light hair, believe that a white woman is incapable of responding to love. It is the brown woman who feels love; as it is said in Sicilian dialect: "Fimmina scura, fimmina amurusa." [164]

The dependence of pigmentation upon the sexual system is shown by the fact that irritation of the genital organs by disease will

frequently suffice to produce a high degree of pigmentation. This may be the neck, the trunk, the hands. Simpson long since noted that uterine irritation apart from pregnancy may produce pigmentation of the areolæ of the nipples (*Obstetric Works*, vol. i, p. 345). Engelmann discussed the subject and gave cases, "The Hystero-Neuroses," pp. 124-139, in *Gynæcological Transactions*, vol. xii, 1887; and a summary of a memoir by Fouquet on this subject in *La Gynécologie*, February, 1903, will be found in *British Medical Journal*, March 28, 1903,

Of all physical traits vigor of the hairy system has most frequently perhaps been regarded as the index of vigorous sexuality. In this matter modern medical observations are at one with popular belief and ancient physiognomical assertions.[165] The negative test of castration and the positive test of puberty point in the same direction.

It is at puberty that all the hair on the body, except that on the head, begins to develop; indeed, the very word "puberty" has reference to this growth as the most obvious sign of the whole process. When castration takes place at an early age all this development of pubescent hair is arrested. When the primary sexual organs are undeveloped the sexual hair is also undeveloped, as in a case, recorded by Plant,[166] of a girl with rudimentary uterus and ovaries who had little or no axillary and pubic hair, although the hair of the head was long and strong.[167]

The pseudo-Michael Scot among the *Signa mulieris*

calidæ naturæ

et quæ coit libenter_ stated that her hair, both on the head and

body, is thick and coarse and crisp, and Della Porta, the

greatest of the physiognomists, said that thickness of hair in

women meant wantonness. Venette, in his _Generation de l'Homme_,

remarked that men who have much hair on the body are most

amorous. At a more recent period Roubaud has said that pubic hair

in its quantity, color and curliness is an index of genital

energy. A poor pilous system, on the other hand, Roubaud regarded

as a probable though not an irrefragable proof of sexual

frigidity in women. "In the cold woman the pilous system is

remarkable for the languor of its vitality; the hairs are fair,

delicate, scarce and smooth, while in ardent natures there are

little curly tufts about the temples." (_Traité de l'Impuissance_, pp. 124, 523.) Martineau declared

(_Leçons sur les Déformations Vulvaires_, p. 40) that "the more developed the

genital organs the more abundant the hair covering them;

abundance of hair appears to be in relation to the perfect

development of the organs." Tardieu described the typically

erotic woman as very hairy.

Bergh found that among 2200 young Danish prostitutes those who

showed an unusual extension and amount of pubic hair included

several women who were believed to be libidinous in a very high

degree. (Bergh, "Symbolæ," etc., _Hospitalstidende_,

August,
1894.) Moraglia, again, in Italy, in describing various women, mostly prostitutes, of unusually strong sexual proclivities, repeatedly notes very thick hair, with down on the face.
(*_Archivio di Psichiatria_*, vol. xvi, fasc. iv-v.)

Marro, also, in Italy found that abundance of hair and down is especially marked in women who are guilty of infanticide (as also Pasini has found), though criminal women generally, in his experience, tend to have abnormally abundant hair.
(*_Caratteri del Delinquenti_*, cap. XXII.) Lombroso finds that prostitutes generally tend to be hairy (*_Donna Delinquente_*, p. 320.)

A lad of 14, guilty of numerous crimes of violence having a sexual source, is described by Arthur Macdonald in America as having hair on the chest as well as all over the pubes. (A. Macdonald, *_Archives de L'Anthropologie Criminelle_*, January, 1893, p. 55.) The association of hairiness with abnormal sexuality in the weak-minded has been noted at Bicêtre (*_Recherches Cliniques sur l'Epilepsie_*, vol. xix, pp. 69, 77.)

Hypertrichosis universalis, a general hairiness of body, has been described by Cascella in a woman with very strong sexual desires, who eventually became insane. (*_Revista Mensile di Psichiatria_*, 1903, p. 408.) Bucknill and Tuke give the case of a religiously

mindful girl, with very strong and repressed sexual desires, who became insane; the only abnormal feature in her physical development was the marked growth of hair over the body.

Brantôme refers to a great lady known to him whose body was very hairy, and quotes a saying to the effect that hairy people are either rich or wanton; the lady in question, he adds, was both.
(Brantôme, *Vie des Dames Galantes*, Discours II.)

De Sade, whose writings are now regarded as a treasure house of true observations in the domain of sexual psychology, makes the Rodin of *Justine* dark, with much hair and thick eyebrows, while his very sexual sister is described as dark, thin and very hairy.
(Dühren, *Der Marquis de Sade*, third edition, p. 440.)

A correspondent who has always taken a special interest in the condition as regards hairiness of the women to whom he has been attracted, has sent me notes concerning a series of 12 women. It may be gathered from these notes that 5 women were neither markedly sexual nor markedly hairy (either as regards head or pubes), 6 cases both hairy and sexual, 1 was sexual and not hairy, none were hairy and not sexual. My correspondent remarks:
"There may be women with scanty pubic hair possessing very strong sexual emotions. My own experience is quite the opposite." He has also independently reached the conclusion, arrived

at by many
medical observers and clearly suggested by some of
the facts here
brought together, that profuse hair frequently
denotes a neurotic
temperament.

It may be added that Mirabeau, as we learn from an
anecdote told
by an eyewitness and recorded by Legouvé, had a very
hairy chest,
while the same is recorded of Restif de la Bretonne.

It is a very ancient and popular belief that if a hairy
man is not sensual
he is strong: *_vir pilosus aut libidinosus aut fortis_*.
The Greeks
insisted on the hairy nates of Hercules, and Ninon de
l'Enclos, when the
great Condé shared her bed without touching her,
remarked, on seeing his
hairy body: "Ah, Monseigneur, que vous devez être fort!"
It may be doubted
whether there is any exact parallelism between muscular
strength and
hairiness, for strength is largely a matter of training,
but there can be
no doubt that hairiness really tends to be associated
with a generally
vigorous development of the body.

Although the observations concerning hairiness of body
as an index of
vigor, whether sexual or only generally physical, are so
ancient, until
recent years no attempts have been made to demonstrate
on a large scale
whether there is actually a correlation between
hairiness and sexual or
general development of the body. Some importance,
therefore, attaches to
Ammon's careful observations of many thousand conscripts
in Baden. These
observations fully justify this ancient belief, since
they show that on

the one hand the size of the testicles, and on the other hand girth of chest and stature, are correlated with hairiness of body.

Ammon's observations were made on nearly 4000 conscripts of the age of 20. From the point of view of the hairy system he divided them, into four classes:--

I. To which 6.1 per cent, of the men belonged, with smooth bodies.

II. Including 25.3 per cent., only slight hairiness.

III. 53.8 per cent., more developed hairy system, but belly, breast and back smooth.

IV. 14.7 per cent., hair all over body.

V. 0.1 per cent., extreme cases of hairiness.

The beardless were 12.1 per cent., those with no axillary hair 9 per cent., those with no hair on pubis 0.4 per cent. This corresponds with the fact that hair appears first on the pubis and last on the chin.

In the first class 69 per cent, were beardless, 54 per cent, without any axillary hair and 6 per cent, without pubic hair. In the second class 24 per cent, were beardless, 17 per cent, without axillary hair. In the third class 3 per cent, were beardless and 3 per cent without axillary hair.

Below puberty the diameter of testicles is below 14 millimeters.

There were 13 conscripts having a testicular diameter of less than 14 millimeters. These infantile individuals all belonged to the first three classes and mostly to the first. The average testicular diameter in the first class was nearly 24 millimeters, and progressively rose in the succeeding classes to over 26 millimeters in the fourth.

While there was not much difference in height, the first class was the shortest, the fourth the tallest. The fourth class also showed the greatest chest perimeter. The cephalic index of all classes was 84. (O. Ammon, "L'Infantilisme et le Feminisme au Conseil de Révision," *L'Anthropologie*, May-June, 1896.)

We thus see that it is quite justifiable to admit a type of person who possesses a more than average aptitude for detumescence. Such persons are more likely to be short than tall; they will show a full development of the secondary sexual characters; the voice will tend to be deep and the eyes bright; the glandular activity of the skin will probably be marked, the lips everted; there is a tendency to a more than average degree of pigmentation, and there is frequently an abnormal prevalence of hair on some parts of the body. While none of these signs, taken separately, can be said to have any necessary connection with the sexual impulse, taken altogether they indicate an organism that responds to the instinct of detumescence with special aptitude or with marked energy. In these

respects observation, both scientific and popular, concords with the probabilities suggested by the three standards in this matter which have already been set forth.

No generalization, however, can here be set down in an absolute and unqualified manner. There are definite reasons why this should be so.

There is, for instance, the highly important consideration that the sexual impulse of the individual may be conspicuous in two quite distinct ways.

It may assume prominence because the individual possesses a highly vigorous and well-nourished organism, or its prominence may be due to mental irritation in a very morbid individual. In the latter case--although occasionally the two sets of conditions are combined--most of the signs we might expect in the former case may be absent. Indeed, the sexual impulses which proceed from a morbid psychic irritability do not in most cases indicate any special aptitude for detumescence at all; in that largely lies their morbid character.

Again, just in the same way that the exaggerated impulse itself may either be healthy or morbid, so the various characters which we have found to possess some value as signs of the impulse may themselves either be healthy or morbid. This is notably the case as regards an abnormal growth of hair on the body, more especially when it appears on regions where normally there is little or no hair. Such hypertrichosis is frequently degenerative in character, though still often associated with the sexual system. When, however, it is thus a degenerative

character of sexual nature, having its origin in some abnormal foetal condition or later atrophy of the ovaries, it is no necessary indication of any aptitude for detumescence.

Idiots, more especially it would seem idiot girls, tend to show a highly developed hairy system. Thus Voisin, when investigating 150 idiot and imbecile girls, found the hair long and thick and tending to occupy a large surface; one girl had hair on the areolæ of the mamma. (J. Voisin, "Conformation des organes génitaux chez les Idiots," Annales d'Hygiène Publique, June, 1894.) It should be said that in idiot boys puberty is late, and the sexual organs as well as the sexual instinct frequently undeveloped, while in idiot girls there is no delay in puberty, and the sexual organs and instinct are frequently fully and even abnormally developed.

Hegar has described an interesting case showing an association, of foetal origin, between sexual anomaly and abnormal hairness. In this case a girl of 16 had a uterus duplex, an infantile pelvis, very slight menstruation and undeveloped breasts. She was very hairy on the face, the anterior aspects of the chest and abdomen, the sexual regions, and the thighs, but not specially so on the rest of the body. The hairs were of lanugo-like character, but dark in color. (A. Hegar, Beiträge zur Geburtshülfe und

Gynäkologie_, vol. i, p. III, 1898.) Sometimes
hiruties of the
face and abdomen begin to appear during pregnancy,
apparently
from disease or degeneration of the ovaries. (A case
is noted in
British Medical Journal, August 2 and 16, pp. 375
and 436,
1902.) Laycock many years ago referred to the
popular belief that
women who have hair on the upper lip seldom bear
children, and
regarded this opinion as "questionless founded on
fact."
(Laycock, _Nervous Diseases of Women_, p. 22.) When
this is so,
we may suppose that the abnormal hairy growth is
associated with
degeneration of the ovaries.

There is another factor which enters into this question
and renders the
definition of a physical sexual type less precise than
it would otherwise
be. The sexual instinct is common to all persons, and
while it seems
probable that there is a type of person in whom sexual
energies are
predominant, it would also appear that the people who
otherwise show a
very high level of energy in life usually exhibit a more
than average
degree of energy in matters of love. The predominantly
sexual type, as we
have seen, tends to be associated with a high degree of
pigmentation; the
person specially apt for detumescence inclines to belong
to the dark
rather than to the purely fair group of the population.
On the other hand,
the active, energetic, practical man, the man who is
most apt for the
achievement of success in life, tends to belong to the
fair rather than to
the dark type.[168] Thus we have a certain conflict of

tendencies, and it becomes possible to assert that while persons with pronounced aptitude for sexual detumescence tend to be dark, persons whose pronounced energy in sexual matters tends to ensure success are most likely to be fair.

The tendency of the fair energetic type, the type of the northern

European man, to sexuality may be connected with the fact that

the violent and criminal man who commits sexual crimes tends to

be fair even amid a dark population. Criminals on the whole would

appear to tend to be dark rather than fair; but Marro found in

Italy that the group of sexual offenders differed from all other

groups of criminals in that their hair was predominantly fair.

(*Caratteri del Delinquenti*, p. 374.) Ottolenghi, in the same

way, in examining 100 sexual offenders, found that they showed 17

per cent., of fair hair, though criminals generally (on a basis

of nearly 2000) showed only 6 per cent., and normal persons

(nearly 1000) 9 per cent. Similarly while the normal persons

showed only 20 per cent. of blue eyes and criminals generally 36

per cent., the sexual offenders showed 50 per cent. of blue eyes.

(Ottolenghi, *Archivio di Psichiatria*, fasc. vi, 1888, p. 573.)

Burton remarked (*Anatomy of Melancholy*, Part III, Section II,

Mem. II, Subs. II) that in all ages most amorous young men have

been yellow-haired, adding, "Synesius holds every effeminate

fellow or adulterer is fair-haired." In folk-lore,

it has been

noted (Kryptadia, vol. ii, p. 258), red or yellow hair is sometimes regarded as a mark of sexuality.

In harmony with this fairness, sexual offenders would appear to

be more dolichocephalic than other criminals. In Italy Marro

found the foreheads of sexual offenders to be narrow, and in

California Drähms found that while murderers had an average

cephalic index of 83.5, and thieves of 80.5, that of sexual offenders was 79.

On the other hand, high cheek-bones and broad faces--a condition

most usually found associated with brachycephaly--have sometimes

been noted as associated with undue or violent sexuality. Marro

noted the excess of prominent cheek-bones in sexual offenders,

and in America it has been found that unchaste girls tend to have

broad faces. (Pedagogical Seminary, December, 1896, pp. 231, 235.)

It will be seen that, when we take a comprehensive view of the facts and considerations involved, it is possible to obtain a more definite and coherent picture of the physical signs of a marked aptitude for detumescence than has hitherto been usually supposed possible. But we also see that while the ensemble of these signs is probably fairly reliable as an index of marked sexuality, the separate signs have no such definite significance, and under some circumstances their significance may even be

reversed.

[158] In European folk-lore thick lips in a woman are sometimes regarded as a sign of sensuality, *Kryptadia*, vol. ii, p, 258.

[159] The direct dependence of sexual pigmentation on the primary sexual glands is well illustrated by a true hermaphroditic adult finch exhibited at the Academy of Sciences of Amsterdam (May 31, 1890); this bird had a testis on the right side and an ovary on the left, and on the right side its plumage was of the male's colors, on the left of the female's color.

[164] C. Pitre, *_Medicina Populare Siciliana_*, p. 47. In England, from notes sent to me by one correspondent, it would appear that the proportion of dark and sexually apt women to fair and sexually apt women is as 3 to 1. The experience of others would doubtless give varying results, and in any case the fallacies are numerous. See, in the previous volume of these *_Studies_*, "Sexual Selection in Man," Section IV.

[165] In Japan the same belief would appear to be held. In a nude figure representing the typical voluptuous woman by the Japanese painter Marugama Okio (reproduced in Ploss's Das Weib) the pubic and axillary hair is profuse, though usually sparse in Japan.

[166] Centralblatt für Gynäkologie, No. 9, 1896.

[167] It is important to remember that there is little correlation in this matter between the hair of the head and the sexual hair, if not a certain opposition. (See ante, p. 127.) According to one of the aphorisms of Hippocrates, repeated by Buffon, eunuchs do not become bald, and Aristotle seems to have believed that sexual intercourse is a cause of baldness in men. (Laycock, Nervous Diseases of Women, p. 23.)

[168] For some of the evidence on this point, see Havelock Ellis, "The Comparative Abilities of the Fair and the Dark," Monthly Review, August, 1901; cf. id., A Study of British Genius, Chapter X.

THE PSYCHIC STATE IN PREGNANCY.

The Relationship of Maternal and Sexual Emotion--

-Imperfection of
Our Knowledge--The Significance of Pregnancy.

In analyzing the sexual impulse I have so far deliberately kept out of view the maternal instinct. This is necessary, for the maternal instinct is specific and distinct; it is directed to an aim which, however intimately associated it may be with that of the sexual impulse proper, can by no means be confounded with it. Yet the emotion of love, as it has finally developed in the world, is not purely of sexual origin; it is partly sexual, but it is also partly parental.[169]

In so far as it is parental it is certainly mainly maternal. There is a drawing by Bronzino in the Louvre of a woman's head gazing tenderly down at some invisible object; is it her child or her lover? Doubtless her child, yet the expression is equally adequate to the emotion evoked by a lover. If we were here specifically dealing with the emotion of love as a complex whole, and not with the psychology of the sexual impulse, it would certainly be necessary to discuss the maternal instinct and its associated emotions. In any case it seems desirable to touch on the psychic state of pregnancy, for we are here concerned not only with emotions very closely connected with the sexual emotions in the narrower sense, but we here at last approach that state which it is the object of the whole sexual process to achieve.

In civilized life a period of weeks, months, even years, may elapse between the establishment of sexual relations and the

occurrence of
conception. Under primitive conditions the loss of the
virginal condition
practically involves the pregnant condition, so that
under primitive
conditions very little allowance is made for the state,
so common among
civilized peoples, of the woman who is no longer a
virgin, yet not about
to become a mother.

There is some interest in noting the signs of loss
of virginity
chiefly relied upon by ancient authors. In doing
this it is
convenient to follow mainly the full summary of
authorities given
by Schurig in his *_Parthenologia_* early in the
eighteenth
century. The ancient custom, known in classic times,
of measuring
the neck the day after marriage was frequently
practiced to
ascertain if a girl was or was not a virgin. There
were various
ways of doing this. One was to measure with a thread
the
circumference of the bride's neck before she went to
bed on the
bridal night. If in the morning the same thread
would not go
around her neck it was a sure sign that she had lost
her
virginity during the night; if not, she was still a
virgin or had
been deflowered at an earlier period. Catullus
alluded to this
custom, which still exists, or existed until lately,
in the south
of France. It is perfectly sound, for it rests on
the intimate
response by congestion of the thyroid gland to
sexual excitement.
(*_Parthenologia_*, p. 283; Biérent, *_La Puberté_*, p.
150; Havelock

Ellis, Man and Woman, fourth edition, p. 267.)

Some say, Schurig tells us, that the voice, which in the virgin

is shrill, becomes rougher and deeper after the first coitus. He

quotes Riolan's statement that it is certain that the voice of

those who indulge in venery is changed. On that account the

ancients bound down the penis of their singers, and Martial said

that those who wish to preserve their voices should avoid coitus.

Democritus who one day had greeted a girl as "maiden" on the

following day addressed her as "woman," while in the same way it

is said that Albertus Magnus, observing from his study a girl

going for wine for her master, knew that she had had sexual

intercourse by the way because on her return her voice had become

deeper. Here, again, the ancient belief has a solid basis, for

the voice and the larynx are really affected by sexual

conditions. (Parthenologia, p. 286; Marro, La Puberté, p.

303; Havelock Ellis, op. cit., pp. 271, 289.)

Others, again, Schurig proceeds, have judged that the goaty smell

given out in the armpits during the venereal act is also no

uncertain sign of defloration, such odor being perceptible in

those who use much venery, and not seldom in harlots and the

newly married, while, as Hippocrates said, it is not perceived in

boys and girls. (Parthenologia, p. 286; cf. the previous volume

of these Studies, "Sexual Selection in Man," p.

64.)

In virgins, Schurig remarks, the pubic hair is said to be long and not twisted, while in women accustomed to coitus it is crisper. But it is only after long and repeated coitus, some authors add, that the pubic hairs become crisp. Some recent observers, it may be remarked, have noted a connection between sexual excitation and the condition of the pubic hair in women. (Cf. the present volume, *_ante_* p. 127.)

A sign to which the old authors often attached much importance was furnished by the urinary stream. In the *_De Secretis Mulierum_*, wrongly attributed to Albertus Magnus, it is laid down that "the virgin urinates higher than the woman." Riolan, in his *_Anthropographia_*, discussing the ability of virgins to ejaculate urine to a height, states that Scaliger had observed women who were virgins emit urine in a high jet against a wall, but that married women could seldom do this. Bouaciolus also stated that the urine of virgins is emitted in a small stream to a distance with an acute hissing sound. (*_Parthenologia_*, p. 281.) A folk-lore belief in the reality of this influence is evidenced by the Picardy *_conte_* referred to already (*_ante_*, p. 53), "La Princesse qui pisse au dessus les Meules." There is no doubt a tendency for the various stresses of sexual life to produce an influence in this direction, though they act far too

slowly and

uncertainly to be a reliable index to the presence
or the absence
of virginity.

Another common ancient test of virginity by
urination rests on a

psychic basis, and appears in a variety of forms
which are really

all reducible to the same principle. Thus we are
told in De

Secretis Mulierum that to ascertain if a girl is
seduced she

should be given to eat of powdered crocus flowers,
and if she has

been seduced she immediately urinates. We are here
concerned with

auto-suggestion, and it may well be believed that
with nervous

and credulous girls this test often revealed the
truth.

A further test of virginity discussed by Schurig is
the presence

of modesty of countenance. If a woman blushes her
virtue is safe.

In this way girls who have themselves had experience
of the

marriage bed are said to detect the virgin. The
virgin's eyes are

cast down and almost motionless, while she who has
known a man

has eyes that are bright and quick. But this sign is
equivocal,

says Schurig, for girls are different, and can
simulate the

modesty they do not feel. Yet this indication also
rests on a

fundamentally sound psychological basis. (See "The
Evolution of

Modesty," in the first volume of these Studies.)

In his Syllepsilogia (Section V, cap. I-II),
published in 1731,

Schurig discusses further the anciently recognized

signs of

pregnancy. The real or imaginary signs of pregnancy sought by

various primitive peoples of the past and present are brought

together by Ploss and Bartels, *Das Weib*, bd. i, Chapter XXVII.

Both physically and psychically the occurrence of pregnancy is, however, a distinct event. It marks the beginning of a continuous physical process, which cannot fail to manifest psychic reactions. A great center of vital activity--practically a new center, for only the germinal form of it in menstruation had previously existed--has appeared and affects the whole organism. "From the moment that the embryo takes possession of the woman," Robert Barnes puts it, "every drop of blood, every fiber, every organ, is affected." [170]

A woman artist once observed to Dr. Stratz, that as the final aim of a woman is to become a mother and pregnancy is thus her blossoming time, a beautiful woman ought to be most beautiful when she is pregnant. That is so, Stratz replied, if her moment of greatest physical perfection corresponds with the early months of pregnancy, for with the beginning of pregnancy metabolism is increased, the color of the skin becomes more lively and delicate, the breasts firmer. [171] Pregnancy may, indeed, often become visible soon after conception by the brighter eye, the livelier glance, resulting from greater vascular activity, though later, with the increase of strain, the face may tend to become somewhat thin and distorted. The hair, Barnes states, assumes a new vigor,

even though it
may have been falling out before. The temperature rises;
the weight
increases, even apart from the growth of the foetus. The
efflorescence of
pregnancy shows itself, as in the blossoming and
fecundated flower, by
increased pigmentation.[172] The nipples with their
areolæ, and the
mid-line of the belly, become darker; brown flecks
(lentigo) tend to
appear on the forehead, neck, arms, and body; while
striæ--at first
blue-red, then a brilliant white--appear on the belly
and thighs, though
these are scarcely normal, for they are not seen in
women with very
elastic skins and are rare among peasants and
savages.[173] The whole
carriage of the woman tends to become changed with the
development of the
mighty seed of man planted within her; it simulates the
carriage of pride
with the arched back and protruded abdomen.[174] The
pregnant woman has
been lifted above the level of ordinary humanity to
become the casket of
an inestimable jewel.

It is in the blood and the circulation that the earliest
of the most
prominent symptoms of pregnancy are to be found. The
ever increasing
development of this new focus of vascular activity
involves an increased
vascular activity in the whole organism. This activity
is present almost
from the first--a few days after the impregnation of the
ovum--in the
breasts, and quickly becomes obvious to inspection and
palpation. Before a
quite passive organ, the breast now rapidly increases in
activity of
circulation and in size, while certain characteristic
changes begin to

take place around the nipples.[175] As a result of the additional work imposed upon it the heart tends to become slightly hypertrophied in order to meet the additional strain; there may be some dilatation also.[176]

The recent investigations of Stengel and Stanton tend to show that the increase of the heart's work during pregnancy is less considerable than has generally been supposed, and that beyond some enlargement and dilatation of the right ventricle there is not usually any hypertrophy of the heart.

The total quantity of blood is raised. While increased in quantity, the blood appears on the whole to be somewhat depreciated in quality, though on this point there are considerable differences of opinion. Thus, as regards hæmoglobin, some investigators have found that the old idea as to the poverty of hæmoglobin in pregnancy is quite unfounded; a few have even found that the hæmoglobin is increased. Most authorities have found the red cells diminished, though some only slightly, while the white cells, and also the fibrin, are increased. But toward the end of pregnancy there is a tendency, perhaps due to the establishment of compensation, for the blood to revert to the normal condition.[177]

It would appear probable, however, that the vascular phenomena of pregnancy are not altogether so simple as the above statement would imply. The activity of various glands at this time--well illustrated by the marked salivation which sometimes occurs--indicates that other modifying

forces are at work, and it has been suggested that the changes in the maternal circulation during pregnancy may best be explained by the theory that there are two opposing kinds of secretion poured into the blood in unusual degree during pregnancy: one contracting the vessels, the other dilating them, one or the other sometimes gaining the upper hand. Suprarenal extract, when administered, has a vasoconstricting influence, and thyroid extract a vasodilating influence; it may be surmised that within the body these glands perform similar functions.[178]

The important part played by the thyroid gland is indicated by its marked activity at the very beginning of pregnancy. We may probably associate the general tendency to vasodilatation during early pregnancy with the tendency to goitre; Freund found an increase of the thyroid in 45 per cent. of 50 cases. The thyroid belongs to the same class of ductless glands as the ovary, and, as Bland Sutton and others have insisted, the analogies between the thyroid and the ovary are very numerous and significant. It may be added that in recent years Armand Gautier has noted the importance of the thyroid in elaborating nucleoproteids containing arsenic and iodine, which are poured into the circulation during menstruation and pregnancy. The whole metabolism of the body is indeed affected, and during the latter part of pregnancy study of the ingesta and egesta has shown that a storage of nitrogen and even of water is taking place.[179] The woman, as Pinard puts it, forms the child out of her own

flesh, not merely out of her food; the individual is being sacrificed to the species.

The changes in the nervous system of the pregnant woman correspond to those in the vascular system. There is the same increase of activity, a heightening of tension. Bruno Wolff, from experiments on bitches, concluded that the central nervous system in women is probably more easily excited in the pregnant than in the non-pregnant state, though he was not prepared to call this cerebral excitability "specific." [180] Direct observations on pregnant women have shown, without doubt, a heightened nervous irritability. Reflex action generally is increased. Neumann investigated the knee-jerk in 500 women during pregnancy, labor, and the puerperium, and in a large number found that there was a progressive exaggeration with the advance of pregnancy, little or no change being observed in the early months; sometimes when no change was observed during pregnancy the knee-jerk still increased during labor, reaching its maximum at the moment of the expulsion of the foetus; the return to the normal condition took place gradually during the puerperium. Tridandani found in pregnant women that though the superficial reflexes, with the exception of the abdominal, were diminished, the deep and tendon reflexes were markedly increased, especially that of the knee, these changes being more marked in primiparæ than in multiparæ, and more pronounced as pregnancy advanced, the normal condition returning with ten days after labor. Electrical excitability was sensibly diminished. [181]

One of the first signs of high nervous tension is vomiting. As is well known, this phenomenon commonly appears early in pregnancy, and it is by many considered entirely physiological. Barnes regards it as a kind of safety valve, a regulating function, letting off excessive tension and maintaining equilibrium.[182] Vomiting is, however, a convulsion, and is thus the simplest form of a kind of manifestation--to which the heightened nervous tension of pregnancy easily lends itself--that finds its extreme pathological form in eclampsia. In this connection it is of interest to point out that the pregnant woman here manifests in the highest degree a tendency which is marked in women generally, for the female sex, apart altogether from pregnancy, is specially liable to convulsive phenomena.[183]

There is some slight difference of opinion among authorities as to the precise nature and causation of the sickness of pregnancy.

Barnes, Horrocks and others regard it as physiological; but many consider it pathological; this is, for instance, the opinion of

Giles. Graily Hewitt attributed it to flexion of the gravid uterus, Kaltenbach to hysteria, and Zaborsky terms it a neurosis.

Whitridge Williams considers that it may be (1) reflex, or (2) neurotic (when it is allied to hysteria and amenable to

suggestion), or (3) toxæmic. It really appears to lie on the

borderland between healthy and diseased manifestations. It is

said to be unknown to farmers and veterinary surgeons. It appears to be little known among savages; it is comparatively infrequent among women of the lower social classes, and, as Giles has found, women who habitually menstruate in a painless and normal manner suffer comparatively little from the sickness of pregnancy.

We owe a valuable study of the sickness of pregnancy to Giles, who analyzed the records of 300 cases. He concluded that about one-third of the pregnant women were free from sickness throughout pregnancy, 45 per cent. were free during the first three months. When sickness occurred it began in 70 per cent. of cases in the first month, and was most frequent during the second month. The duration varied from a few days to all through. Between the ages of 20 and 25 sickness was least frequent, and there was less sickness in the third than in any other pregnancy.

(This corresponds with the conclusion of Matthews Duncan that 25 is the most favorable age for pregnancy.) To some extent in agreement with Guéniot, Giles believes that the vomiting of pregnancy is "one form of manifestation of the high nervous irritability of pregnancy." This high nervous tension may overflow into other channels, into the vascular and excretory system, causing eclampsia; into the muscular system, causing chorea, or, expending itself in the brain, give rise to hysteria

when mild or insanity when severe. But the vagi form a very ready channel for such overflow, and hence the frequency of sickness in pregnancy. There are thus three main factors in the causation of this phenomenon: (1) An increased nervous irritability; (2) a local source of irritation; (3) a ready efferent channel for nervous energy. (Arthur Giles, "Observations on the Etiology of the Sickness of Pregnancy," Transactions Obstetrical Society of London, vol. xxv, 1894.)

Martin, who regards the phenomenon as normal, points out that when nausea and vomiting are absent or suddenly cease there is often reason to suspect something wrong, especially the death of the embryo. He also remarks that women who suffer from large varicose veins are seldom troubled by the nausea of pregnancy. (J.M.H. Martin, "The Vomiting of Pregnancy," British Medical Journal, December 10, 1904.) These observations may be connected with those of Evans (American Gynæcological and Obstetrical Journal, January, 1900), who attributes primary importance to the undoubtedly active factor of the irritation set up by the uterus, more especially the rhythmic uterine contractions; stimulation of the breasts produces active uterine contractions, and Evans found that examination of the breasts sufficed to bring on a severe attack of vomiting, while on another occasion this was produced by a vaginal examination. Evans

believes that the
purpose of these contractions is to facilitate the
circulation of
the blood through the large venous sinuses, the
surcharging of
the relatively stagnant pools with effete blood
producing the
irritation which leads to rhythmic contractions.

It is on the basis of the increased vascular and
glandular activity and
the heightened nervous tension that the special psychic
phenomena of
pregnancy develop. The best known, and perhaps the most
characteristic of
these manifestations, is that known as "longings." By
this term is meant
more or less irresistible desires for some special food
or drink, which
may be digestible or indigestible, sometimes a substance
which the woman
ordinarily likes, such as fruit, and occasionally one
which, under
ordinary circumstances, she dislikes, as in one case
known to me of a
young country woman who, when bearing her child, was
always longing for
tobacco and never happy except when she could get a pipe
to smoke,
although under ordinary circumstances, like other young
women of her
class, she was without any desire to smoke. Occasionally
the longings lead
to actions which are more unscrupulous than is common in
the case of the
same person at other times; thus in one case known to me
a young woman,
pregnant with her first child, insisted to her sister's
horror on entering
a strawberry field and eating a quantity of fruit. These
"longings" in
their extreme form may properly be considered as
neurasthenic obsessions,
but in their simple and less pronounced forms they may
well be normal and

healthy.

The old medical authors abound in narratives describing the longings of pregnant women for natural and unnatural foods. This affection was commonly called *pica*, sometimes *citra* or *malatia*. Schurig, whose works are a comprehensive treasure house of ancient medical lore, devotes a long chapter (cap. II) of his *Chylologia*, published in 1725, to *pica* as manifested mainly, though not exclusively, in pregnant women. Some women, he tells us, have been compelled to eat all sorts of earthy substances, of which sand seems the most common, and one Italian woman when pregnant ate several pounds of sand with much satisfaction, following it up with a draught of her own urine. Lime, mud, chalk, charcoal, cinders, pitch are also the desired substances in other cases detailed. One pregnant woman must eat bread fresh from the oven in very large quantities, and a certain noble matron ate 140 sweet cakes in one day and night. Wheat and various kinds of corn as well as of vegetables were the foods desired by many longing women. One woman was responsible for 20 pounds of pepper, another ate ginger in large quantities, a third kept mace under her pillow; cinnamon, salt, emulsion of almonds, treacle, mushrooms were desired by others. Cherries were longed for by one, and another ate 30 or 40 lemons in one night. Various kinds of fish--mullet, oysters, crabs, live eels,

etc.--are

mentioned, while other women have found delectation in lizards,

frogs, spiders and flies, even scorpions, lice and fleas. A

pregnant woman, aged 33, of sanguine temperament, ate a live fowl

completely with intense satisfaction. Skin, wool, cotton, thread,

linen, blotting paper have been desired, as well as more

repulsive substances, such as nasal mucus and feces (eaten with

bread). Vinegar, ice, and snow occur in other cases. One woman

stilled a desire for human flesh by biting the nates of children

or the arms of men. Metals are also swallowed, such as iron,

silver, etc. One pregnant woman wished to throw eggs in her

husband's face, and another to have her husband throw eggs in her face.

In the next chapter of the same work Schurig describes cases of

acute antipathy which may arise under the same circumstances

(cap. III, "De Nausea seu Antipathia certorum ciborum"). The list

includes bread, meat, fowls, fish, eels (a very common

repulsion), crabs, milk, butter (very often), cheese (often),

honey, sugar, salt, eggs, caviar, sulphur, apples (especially

their odor), strawberries, mulberries, cinnamon, mace, capers,

pepper, onions, mustard, beetroot, rice, mint, absinthe, roses

(many pages are devoted to this antipathy), lilies, elder

flowers, musk (which sometimes caused vomiting), amber, coffee,

opiates, olive oil, vinegar, cats, frogs, spiders, wasps, swords.

More recently Gould and Pyle (Anomalies and Curiosities of Medicine, p. 80) have briefly summarized some of the ancient and modern records concerning the longings of pregnant women.

Various theories are put forward concerning the causation of the longings of pregnant women, but none of these seems to furnish by itself a complete and adequate explanation of all cases. Thus it is said that the craving is the expression of a natural instinct, the system of the pregnant woman really requiring the food she longs for. It is quite probable that this is so in many cases, but it is obviously not so in the majority of cases, even when we confine ourselves to the longings for fairly natural foods, while we know so little of the special needs of the organism during pregnancy that the theory in any case is insusceptible of clear demonstration.

Allied to this theory is the explanation that the longings are for things that counteract the tendency to nausea and sickness. Giles, however, in his valuable statistical study of the longings of a series of 300 pregnant women, has shown that the percentage of women with longings is exactly the same (33 per cent.) among women who had suffered at some time during pregnancy from sickness as among the women who had not so suffered. Moreover, Giles found that the period of sickness frequently bore no relation to the time when there were cravings, and the

patient often had
cravings after the sickness had ceased.

According to another theory these longings are mainly a matter of auto-suggestion. The pregnant woman has received the tradition of such longings, persuades herself that she has such a longing, and then becomes convinced that, according to a popular belief, it will be bad for the child if the longing is not gratified. Giles considers that this process of auto-suggestion takes place "in a certain number, perhaps even in the majority of cases." [184]

The Duchess d'Abrantès, the wife of Marshal Junot, in her Mémoires gives an amusing account of how in her first pregnancy a longing was apparently imposed upon her by the anxious solicitude of her own and her husband's relations. Though suffering from constant nausea and sickness, she had no longings. One day at dinner after the pregnancy had gone on for some months her mother suddenly put down her fork, exclaiming: "I have never asked you what longing you have!" She replied with truth that she had none, her days and her nights being occupied with suffering. "No envie!" said the mother, "such a thing was never heard of. I must speak to your mother-in-law." The two old ladies consulted anxiously and explained to the young mother how an unsatisfied longing might produce a monstrous child, and the husband also now began to ask her every day what she longed for. Her sister-in-law, moreover, brought her all sorts of

stories of

children born with appalling mother's marks due to this cause.

She became frightened and began to wonder what she most wanted,

but could think of nothing. At last, when eating a pastille

flavored with pineapple, it occurred to her that pineapple is an

excellent fruit, and one, moreover, which she had never seen, for

at that time it was extremely rare. Thereupon she began to long

for pineapple, and all the more when she was told that at that

season they could not be obtained. She now began to feel that she

must have pineapple or die, and her husband ran all over Paris,

vainly offering twenty louis for a pineapple. At last he

succeeded in obtaining one through the kindness of Mme.

Bonaparte, and drove home furiously just as his wife, always

talking of pineapples, had gone to bed. He entered the room with

the pineapple, to the great satisfaction of the Duchess's mother.

(In one of her own pregnancies, it appears, she longed in vain

for cherries in January, and the child was born with a mark on

her body resembling a cherry--in scientific terminology, a

nævus.) The Duchess effusively thanked her husband and wished

to eat of the fruit immediately, but her husband stopped her and

said that Corvisart, the famous physician, had told him that she

must on no account touch it at night, as it was extremely

indigestible. She promised not to do so, and spent the night in

caressing the pineapple. In the morning the husband came and cut up the fruit, presenting it to her in a porcelain bowl. Suddenly, however, there was a revulsion of feeling; she felt that she could not possibly eat pineapple; persuasion was useless; the fruit had to be taken away and the windows opened, for the very smell of it had become odious. The Duchess adds that henceforth, throughout her life, though still liking the flavor, she was only able to eat pineapple by doing a sort of violence to herself.

(*Mémoires de la Duchesse d'Abrantès*, vol. iii, Chapter VIII.)

It should be added that, in old age, the Duchess d'Abrantès appears to have become insane.

The influence of suggestion must certainly be accepted as, at all events, increasing and emphasizing the tendency to longings. It can scarcely, however, be regarded as a radical and adequate explanation of the phenomenon generally. If it is a matter of auto-suggestion due to a tradition, then we should expect to find longings most frequent and most pronounced in multiparous women, who are best acquainted with the tradition and best able to experience all that is expected of a pregnant woman. But, as a matter of fact, the women who have borne most children are precisely those who are least likely to be affected by the longings which tradition demands they should manifest. Giles has shown that longings occur much more frequently in the first than in any subsequent pregnancy; there is a regular decrease with the increase

in number of pregnancies until in women with ten or more children the longings scarcely occur at all.

We must probably regard longings as based on a physiological and psychic tendency which is of universal extension and almost or quite normal. They are known throughout Europe and were known to the medical writers of antiquity. Old Indian as well as old Jewish physicians recognized them.

They have been noted among many savage races to-day: among the Indians of North and South America, among the peoples of the Nile and the Soudan, in the Malay archipelago.[185] In Europe they are most common among the women of the people, living simple and natural lives.[186]

The true normal relationship of the longings of pregnancy is with the impulsive and often irresistible longings for food delicacies which are apt to overcome children, and in girls often persist or revive through adolescence and even beyond. Such sudden fits of greediness belong to those kind of normal psychic manifestations which are on the verge of the abnormal into which they occasionally pass. They may occur, however, in healthy, well-bred, and well-behaved children who, under the stress of the sudden craving, will, without compunction and apparently without reflection, steal the food they long for or even steal from their parents the money to buy it. The food thus seized by a well-nigh irresistible craving is nearly always a fruit. Fruit is usually doled out to children in small quantities as a luxury, but we are descended

from primitive human peoples and still more remote ape-like ancestors, by whom fruit was in its season eaten copiously, and it is not surprising that when that season comes round the child, more sensitive than the adult to primitive influences, should sometimes experience the impulse of its ancestors with overwhelming intensity, all the more so if, as is probable, the craving is to some extent the expression of a physiological need.

Sanford Bell, who has investigated the food impulses of children in America, finds that girls have a greater number of likes and dislikes in foods than boys of the same age, though at the same time they have less dislikes to some foods than boys. The proclivity for sweets and fruits shows itself as soon as a child begins to eat solids. The chief fruits liked are oranges, bananas, apples, peaches, and pears. This strong preference for fruits lasts till the age of 13 or 14, though relatively weaker from 10 to 13. In girls, however, Bell notes the significant fact from our present point of view that at mid-adolescence there is a revived taste for sweets and fruits. He believes that the growth of children in taste in foods recapitulates the experience of the race. (S. Bell, "An Introductory Study of the Psychology of Foods." Pedagogical Seminary, March, 1904.)

The heightened nervous impressionability of pregnancy would appear to arouse into activity those primitive impulses which are liable to occur in

childhood and in the unmarried girl continue to the nubile age. It is a significant fact that the longings of pregnant women are mainly for fruit, and notably for so wholesome a fruit as the apple, which may very well have a beneficial effect on the system of the pregnant woman. Giles, in his tabulation of the foods longed for by 300 pregnant women, found that the fruit group was by far the largest, furnishing 79 cases; apples were far away at the head, occurring in 34 cases out of the 99 who had longings, while oranges followed at a distance (with 13 cases), and in the vegetable group tomatoes came first (with 6 cases). Several women declared "I could have lived on apples," "I was eating apples all day," "I used to sit up in bed eating apples." [187] Pregnant women appear seldom to long for the possession of objects outside the edible class, and it seems doubtful whether they have any special tendency to kleptomania. Pinard has pointed out that neither Lasègue nor Lunier, in their studies of kleptomania, have mentioned a single shop robbery committed by a pregnant woman. [188] Brouardel has indeed found such cases, but the object stolen was usually a food.

A further significant fact connecting the longings of pregnant women with the longings of children is to be found in the fact that they occur mainly in young women. We have, indeed, no tabulation of the ages of pregnant women who have manifested longings, but Giles has clearly shown that these chiefly occur in primiparæ, and steadily and rapidly decrease in each successive pregnancy. This fact, otherwise somewhat

difficult of explanation, is natural if we look upon the longings of pregnancy as a revival of those of childhood. It certainly indicates also that we can by no means regard these longings as exclusively the expression of a physiological craving, for in that case they would be liable to occur in any pregnancy unless, indeed, it is argued that with each successive pregnancy the woman becomes less sensitive to her own physiological state.

There has been a frequent tendency, more especially among primitive peoples, to regard a pregnant woman's longings as something sacred and to be indulged, all the more, no doubt, as they are usually of a simple and harmless character. In the Black Forest, according to Ploss and Bartels, a pregnant woman may go freely into other people's gardens and take fruit, provided she eats it on the spot, and very similar privileges are accorded to her elsewhere. Old English opinion, as reflected, for instance, in Ben Jonson's plays (as Dr. Harriet C.B. Alexander has pointed out), regards the pregnant woman as not responsible for her longings, and Kiernan remarks ("Kleptomania and Collectivism," Alienist and Neurologist, November, 1902) that this is in "a most natural and just view." In France at the Revolution a law of the 28th Germinal, in the year III, to some extent admitted the irresponsibility of the pregnant woman generally,-- following the classic precedent, by which a woman could not be

brought before a
court of justice so long as she was pregnant,--but
the Napoleonic
code, never tender to women, abrogated this. Pinard
does not
consider that the longings of pregnant women are
irresistible,
and, consequently, regards the pregnant woman as
responsible.
This is probably the view most widely held. In any
case these
longings seldom come up for medico-legal
consideration.

The phenomena of the longings of pregnancy are linked to
the much more
obscure and dubious phenomena of the influence of
maternal impressions on
the child within the womb. It is true, indeed, that
there is no real
connection whatever between these two groups of
manifestations, but they
have been so widely and for so long closely associated
in the popular mind
that it is convenient to pass directly from one to the
other. The same
name is sometimes given to the two manifestations; thus
in France a
pregnant longing is an envie, while a mother's mark on
the child is also
called an envie, because it is supposed to be due to
the mother's
unsatisfied longing.

The conception of a "maternal impression" (the German
Versehen) rests on
the belief that a powerful mental influence working on
the mother's mind
may produce an impression, either general or definite,
on the child she is
carrying. It makes a great deal of difference whether
the effect of the
impression on the child is general, or definite and
circumscribed. It is
not difficult to believe that a general effect--even, as

Sir Arthur

Mitchell first gave good reason for believing, idiocy-- may be produced on the child by strong and prolonged emotional influence working on the mother, because such general influence may be transmitted through a deteriorated blood-stream. But it is impossible at present to understand how a definite and limited influence working on the mother could produce a definite and limited effect on the child, for there are no channels of nervous communications for the passage of such influences. Our difficulty in conceiving of the process must, however, be put aside if the fact itself can be demonstrated by convincing evidence.

In order to illustrate the nature of maternal impressions, I will summarize a few cases which I have collected from the best medical periodical literature during the past fifteen years. I have exercised no selection and in no way guarantee the authenticity of the alleged facts or the alleged explanation.

They are merely examples to illustrate a class of cases published from time to time by medical observers in medical journals of high repute.

Early in pregnancy a woman found her pet rabbit killed by a cat which had gnawed off the two forepaws, leaving ragged stumps; she was for a long time constantly thinking of this. Her child was born with deformed feet, one foot with only two toes, the other three, the os calcis in both feet being either absent or little

developed. (G.B. Beale, Tottenham, Lancet, May 4, 1889).

Three months and a half before birth of the child the father, a glazier, fell through the roof of a hothouse, severely cutting his right arm, so that he was lying in the infirmary for a long time, and it was doubtful whether the hand could be saved. The child was healthy, but on the flexor surface of the radial side of the right forearm just above the wrist--the same spot as the father's injury--there was a nævus the size of a sixpence. (W. Russell, Paisley, Lancet, May 11, 1889.)

At the beginning of pregnancy a woman was greatly scared by being kicked over by a frightened cow she was milking; she hung on to the animal's teats, but thought she would be trampled to death, and was ill and nervous for weeks afterwards. The child was a monster, with a fleshy substance--seeming to be prolonged from the spinal cord and to represent the brain--projecting from the floor of the skull. Both doctor and nurse were struck by the resemblance to a cow's teats before they knew the woman's story, and this was told by the woman immediately after delivery and before she knew to what she had given birth. (A. Ross Paterson, Reversby, Lincolnshire, Lancet, September 29, 1889.)

During the second month of pregnancy the mother was terrified by a bullock as she was returning from market. The

child reached

full term and was a well-developed male, stillborn.
Its head

"exactly resembled a miniature cow's head;" the
occipital bone

was absent, the parietals only slightly developed,
the eyes were

placed at the top of the frontal bone, which was
quite flat, with

each of its superior angles twisted into a
rudimentary horn.

(J.T. Hislop, Tavistock, Devon, Lancet, November
1, 1890.)

When four months pregnant the mother, a multipara of
30, was

startled by a black and white collie dog suddenly
pushing against

her and rushing out when she opened the door. This
preyed on her

mind, and she felt sure her child would be marked.
The whole of

the child's right thigh was encircled by a shining
black mole,

studded with white hairs; there was another mole on
the spine of

the left scapula. (C.F. Williamson, Horley, Surrey,
Lancet,

October 11, 1890.)

A lady in comfortable circumstances, aged 24, not
markedly

emotional, with one child, in all respects healthy,
early in her

pregnancy saw a man begging whose arms and legs were
"all doubled

up." This gave her a shock, but she hoped no ill
effects would

follow. The child was an encephalous monster, with
the

extremities rigidly flexed and the fingers clenched,
the feet

almost sole to sole. In the next pregnancy she
frequently passed

a man who was a partial cripple, but she was not

unduly

depressed; the child was a counterpart of the last, except that

the head was normal. The next child was strong and well formed.

(C.W. Chapman, London, Lancet, October 18, 1890.)

When the pregnant mother was working in a hayfield her husband

threw at her a young hare he had found in the hay; it struck her

on the cheek and neck. Her daughter has on the left cheek an

oblong patch of soft dark hair, in color and character clearly

resembling the fur of a very young hare. (A. Mackay, Port Appin,

N.B., Lancet, December 19, 1891. The writer records also four

other cases which have happened in his experience.)

When the mother was pregnant her husband had to attend to a sow

who could not give birth to her pigs; he bled her freely, cutting

a notch out of both ears. His wife insisted on seeing the sow.

The helix of each ear of her child at birth was gone, for nearly

or quite half an inch, as if cut purposely. (R.P. Roons, Medical World, 1894.)

A lady when pregnant was much interested in a story in which one

of the characters had a supernumerary digit, and this often

recurred to her mind. Her baby had a supernumerary digit on one

hand. (J. Jenkyns, Aberdeen, British Medical Journal, March 2,

1895. The writer also records another case.)

When pregnant the mother saw in the forest a new-born fawn which

was a double monstrosity. Her child was a similar double monstrosity (*Cephalothora copagus*). (Hartmann, *Münchener Medicinisches Wochenschrift*, No. 9, 1895.)

A well developed woman of 30, who had ten children in twelve years, in the third month of her tenth pregnancy saw a child run over by a street car, which crushed the upper and back part of its head. Her own child was anencephalic and acranial, with entire absence of vault of skull. (F.A. Stahl, *American Journal of Obstetrics*, April, 1896.)

A healthy woman with no skin blemish had during her third pregnancy a violent appetite for sunfish. During or after the fourth month her husband, as a surprise, brought her some sunfish alive, placing them in a pail of water in the porch. She stumbled against the pail and the shock caused the fish to flap over the pail and come in violent contact with her leg. The cold wriggling fish produced a nervous shock, but she attached no importance to this. The child (a girl) had at birth a mark of bronze pigment resembling a fish with the head uppermost (photograph given) on the corresponding part of the same leg. Daughter's health good; throughout life she has had a strong craving for sunfish, which she has sometimes eaten till she has vomited from repletion. (C.F. Gardiner, Colorado Springs, *American Journal of Obstetrics*, February, 1898.)

The next case occurred in a bitch. A thoroughbred fox terrier bitch strayed and was discovered a day or two later with her right foreleg broken. The limb was set under chloroform with the help of Röntgen rays, and the dog made a good recovery. Several weeks later she gave birth to a puppy with a right foreleg that was ill-developed and minus the paw. (J. Booth, Cork, British Medical Journal, September 16, 1899.)

Four months before the birth of her child a woman with four healthy children and no history of deformity in the family fell and cut her left wrist severely against a broken bowl; she had a great fright and shock. Her child, otherwise perfect, was born without left hand and wrist, the stump of arm terminating at lower end of radius and ulna. (G. Ainslie Johnston, Ambleside, British Medical Journal, April 18, 1903.)

The belief in the reality of the transference of strong mental or physical impressions on the mother into physical changes in the child she is bearing is very ancient and widespread. Most writers on the subject begin with the book of Genesis and the astute device of Jacob in influencing the color of his lambs by mental impressions on his ewes. But the belief exists among even more primitive people than the early Hebrews, and in all parts of the world.[189] Among the Greeks there is a trace of the belief in Hippocrates, the first of the world's great physicians, while Soranus,

the most famous of ancient gynæcologists, states the matter in the most precise manner, with instances in proof. The belief continued to persist unquestioned throughout the Middle Ages. The first author who denied the influence of maternal impressions altogether appears to have been the famous anatomist, Realdus Columbus, who was a professor at Padua, Pisa, and Rome at the beginning of the sixteenth century. In the same century, however, another and not less famous Neapolitan, Della Porta, for the first time formulated a definite theory of maternal impressions. A little later, early in the seventeenth century, a philosophic physician at Padua, Fortunatus Licetus, took up an intermediate position which still finds, perhaps reasonably, a great many adherents. He recognized that a very frequent cause of malformation in the child is to be found in morbid antenatal conditions, but at the same time was not prepared to deny absolutely and in every case the influence of maternal impression on such conditions. Malebranche, the Platonic philosopher, allowed the greatest extension to the power of the maternal imagination. In the eighteenth century, however, the new spirit of free inquiry, of radical criticism, and unfettered logic, led to a sceptical attitude toward this ancient belief then flourishing vigorously.[190] In 1727, a few years after Malebranche's death, James Blondel, a physician of extreme acuteness, who had been born in Paris, was educated at Leyden, and practiced in London, published the first methodical and thorough attack on the doctrine of maternal impressions, The Strength of Imagination of

Pregnant Women

Examined_, and exercised his great ability in ridiculing it. Haller, Roederer, and Sömmering followed in the steps of Blondel, and were either sceptical or hostile to the ancient belief. Blumenbach, however, admitted the influence of maternal impressions. Erasmus Darwin, as well as Goethe in his Wahlverwandtschaften, even accepted the influence of paternal impressions on the child. By the beginning of the nineteenth century the majority of physicians were inclined to relegate maternal impressions to the region of superstition. Yet the exceptions were of notable importance. Burdach, when all deductions were made, still found it necessary to retain the belief in maternal impressions, and Von Baer, the founder of embryology, also accepted it, supported by a case, occurring in his own sister, which he was able to investigate before the child's birth. L.W.T. Bischoff, also, while submitting the doctrine to acute criticism, found it impossible to reject maternal impressions absolutely, and he remarked that the number of adherents to the doctrine was showing a tendency to increase rather than diminish. Johannes Müller, the founder of modern physiology in Germany, declared himself against it, and his influence long prevailed; Valentin, Rudolf Wagner, and Emil du Bois-Reymond were on the same side. On the other hand various eminent gynæcologists--Litzmann, Roth, Hennig, etc.--have argued in favor of the reality of maternal impressions.[191]

The long conflict of opinion which has taken place over this opinion has still left the matter unsettled. The acutest critics of

the ancient belief constantly conclude the discussion with an expression of doubt and uncertainty. Even if the majority of authorities are inclined to reject maternal impressions, the scientific eminence of those who accept them makes a decisive opinion difficult. The arguments against such influence are perfectly sound: (1) it is a primitive belief of unscientific origin; (2) it is impossible to conceive how such influence can operate since there is no nervous connection between mother and child; (3) comparatively few cases have been submitted to severe critical investigation; (4) it is absurd to ascribe developmental defects to influences which arise long after the foetus had assumed its definite shape[192]; (5) in any case the phenomenon must be rare, for William Hunter could not find a coincidence between maternal impressions and foetal marks through a period of several years, and Bischoff found no case in 11,000 deliveries. These statements embody the whole of the argument against maternal impressions, yet it is clear that they do not settle the matter. Edgar, in a manual of obstetrics which is widely regarded as a standard work, states that this is "yet a mooted question." [193] Ballantyne, again, in a discussion of this influence at the Edinburgh Obstetrical Society, summarizing the result of a year's inquiry, concluded that it is still "_sub judice_" [194] In a subsequent discussion of the question he has somewhat modified his opinion, and is inclined to deny that definite impressions on the pregnant woman's mind can cause similar defects in the foetus; they are "accidental

coincidences," but he adds that a few of the cases are difficult to explain away. At the same time he fully believes that prolonged and strongly marked mental states of the mother may affect the development of the foetus in her uterus, causing vascular and nutritive disturbances, irregularities of development, and idiocy.[195]

Whether and in how far mental impressions on the mother can produce definite mental and emotional disposition in the child is a special aspect of the question to which scarcely any inquiry has been devoted. So distinguished a biologist as Mr. A.W.

Wallace has, however, called attention to this point, bringing forward evidence on the question and emphasizing the need of further investigation. "Such transmission of mental influence," he remarks, "will hardly be held to be impossible or even very improbable," (A.W. Wallace, "Prenatal Influences on Character," Nature, August 24, 1893.)

It has already been pointed out that a large number of cases of foetal deformities, supposed to be due to maternal impressions, cannot possibly be so caused because the impression took place at a period when the development of the foetus must already have been decided. In this connection, however, it must be noted that Dabney has observed a relationship between the time of supposed mental impressions and the nature of the actual defect which is of considerable significance as an argument in favor of the influence of mental

impressions. He tabulated 90
carefully reported cases from recent medical literature,
and found that 21
of them were concerned with defects of structure of the
lips and palate.
In all but 2 of these 21 the defect was referred to an
impression
occurring within the first three months of pregnancy.
This is an important
point as showing that the assigned cause really falls
within a period when
a defect of development actually could produce the
observed result,
although the person reporting the cases was in many
instances manifestly
ignorant of the details of embryology and teratology.
There was no such
preponderance of early impressions among the defects of
skin and hair
which might well, so far as development is concerned,
have been caused at
a later period; here, in 7 out of 15 cases, it was
distinctly stated that
the impression was made later than the fourth
month.[196]

It would seem, on the whole, that while the influence of
maternal
impressions in producing definite effects on the child
within the womb has
by no means been positively demonstrated, we are not
entitled to reject it
with any positive assurance. Even if we accept it,
however, it must
remain, for the present, an inexplicable fact; the
modus operandi we can
scarcely even guess at. General influences from the
mother on the child we
can easily conceive of as conveyed by the mother's
blood; we can even
suppose that the modified blood might act specifically
on one particular
kind of tissue. We can, again, as suggested by Féré,
very well believe
that the maternal emotions act upon the womb and produce

various kinds and degrees of pressure on the child within, so that the apparently active movements of the foetus may be really consecutive on unconscious maternal excitations.[197] We may also believe that, as suggested by John Thomson, there are slight incoördinations in utero, a kind of developmental neurosis, produced by some slight lack of harmony of whatever origin, and leading to the production of malformations.[198] We know, finally, that, as Féré and others have repeatedly demonstrated during recent years by experiments on chickens, etc., very subtle agents, even odors, may profoundly affect embryonic development and produce deformity. But how the mother's psychic disposition can, apart from heredity, affect specifically the physical conformation or even the psychic disposition of the child within her womb must remain for the present an insoluble mystery, even if we feel disposed to conclude that in some cases such action seems to be indicated.

In comprehending such a connection, however at present undemonstrated, it may well be borne in mind that the relationship of the mother to the child within her womb is of a uniquely intimate character. It is of interest in this connection to quote some remarks by an able psychologist, Dr. Henry Rutgers Marshall; the remarks are not less interesting for being brought forward without any connection with the question of maternal impressions: "It is true that, so far as we know, the

nervous system of the embryo never has a direct connection with the nervous system of the mother: nevertheless, as there is a reciprocity of reaction between the physical body of the mother and its embryonic parasite, the relation of the embryonic nervous system to the nervous system of the mother is not very far removed from the relation of the pre-eminent part of the nervous system of a man to some minor nervous system within his body which is to a marked extent dissociated from the whole neural mass.

"Correspondingly, then, and within the consciousness of the mother, there develops a new little minor consciousness which, although but lightly integrated with the mass of her consciousness, nevertheless has its part in her consciousness taken as a whole, much as the psychic correspondents of the action of the nerve which govern the secretions of the glands of the body have their part in her consciousness taken as a whole.

"It is very much as if the optic ganglia developed fully in themselves, without any closer connection with the rest of the brain than existed at their first appearance. They would form a little complex nervous system almost but not quite apart from the brain system; and it would be difficult to deny them a consciousness of their own; which would indeed form part of the whole consciousness of the individual, but which

would be in a
manner self-dependent." It must, if this is so, be
said that
before birth, on the psychic side, the embryo's
activities "form
part of a complex consciousness which is that of the
mother and
embryo together." "Without subscribing to the
strange stories of
telepathy, of the solemn apparition of a person
somewhere at the
moment of his death a thousand miles away, of the
unquiet ghost
haunting the scenes of its bygone hopes and
endeavors, one may
ask" (with the author of the address in medicine at
the Leicester
gathering of the British Medical Association,
_British Medical
Journal_, July 29, 1905) "whether two brains cannot
be so tuned
in sympathy as to transmit and receive a subtile
transfusion of
mind without mediation of sense. Considering what is
implied by
the human brain with its countless millions of
cells, its
complexities of minute structure, its innumerable
chemical
compositions, and the condensed forces in its
microscopic and
ultramicroscopic elements--the whole a sort of
microcosm of
cosmic forces to which no conceivable compound of
electric
batteries is comparable; considering, again, that
from an
electric station waves of energy radiate through the
viewless air
to be caught up by a fit receiver a thousand miles
distant, it is
not inconceivable that the human brain may send off
still more
subtile waves to be accepted and interpreted by the
fitly tuned

receiving brain. Is it, after all, mere fancy that a mental atmosphere or effluence emanates from one person to affect another, either soothing sympathetically or irritating antipathically?" These remarks (like Dr. Marshall's) were made without reference to maternal impressions, but it may be pointed out that under no conceivable circumstance could we find a brain in so virginal and receptive a state as is the child's in the womb.

On the whole we see that pregnancy induces a psychic state which is at once, in healthy persons, one of full development and vigor, and at the same time one which, especially in individuals who are slightly abnormal, is apt to involve a state of strained or overstrained nervous tension and to evoke various manifestations which are in many respects still imperfectly understood. Even the specifically sexual emotions tend to be heightened, more especially during the earlier period of pregnancy. In 24 cases of pregnancy in which the point was investigated by Harry Campbell, sexual feeling was decidedly increased in 8, in one case (of a woman aged 31 who had had four children) being indeed only present during pregnancy, when it was considerable; in only 7 cases was there diminution or disappearance of sexual feeling.[199] Pregnancy may produce mental depression;[200] but on the other hand it frequently leads to a change of the most favorable character in the mental and general well-being. Some women indeed are only well during pregnancy. It is

remarkable that some women who habitually suffer from various nervous troubles--neuralgias, gastralgia, headache, insomnia--are only free from them at this moment. This "paradox of gestation," as Vinay has termed it, is specially marked in the hysterical and those suffering from slight nervous disorders, but it is by no means universal, so that although it is possible, Vinay states, to confirm the opinion of the ancients as to the beneficial action of marriage on hysteria, that is only true of slight cases and scarcely enables us to counsel marriage in hysteria.[201] Even a woman's intelligence is sometimes heightened by pregnancy, and Tarnier, as quoted by Vinay, knew many women whose intelligence, habitually somewhat obtuse, has only risen to the normal level during pregnancy.[202] The pregnant woman has reached the climax of womanhood; she has attained to that state toward which the periodically recurring menstrual wave has been drifting her at regular intervals throughout her sexual life[203]; she has achieved that function for which her body has been constructed, and her mental and emotional disposition adapted, through countless ages.

And yet, as we have seen, our ignorance of the changes effected by the occurrence of this supremely important event--even on the physical side--still remains profound. Pregnancy, even for us, the critical and unprejudiced children of a civilized age, still remains, as for the children of more primitive ages, a mystery. Conception itself is a mystery for the primitive man, and may be produced by all sorts of subtle ways

apart from sexual connection, even by smelling a flower.[204] The pregnant woman was surrounded by ceremonies, by reverence and fear, often shut up in a place apart.[205] Her presence, her exhalations, were of extreme potency; even in some parts of Europe to-day, as in the Walloon districts of Belgium, a pregnant woman must not kiss a child for her breath is dangerous, or urinate on plants for she will kill them.[206] The mystery has somewhat changed its form; it still remains. The future of the race is bound up with our efforts to fathom the mystery of pregnancy. "The early days of human life," it has been truly said, "are entirely one with the mother. On her manner of life--eating, drinking, sleeping, and thinking--what greatness may not hang?"[207] Schopenhauer observed, with misapplied horror, that there is nothing a woman is less modest about than the state of pregnancy, while Weininger exclaims: "Never yet has a pregnant woman given expression in any form--poem, memoirs, or gynæcological monograph--to her sensations or feelings." [208] Yet when we contemplate the mystery of pregnancy and all that it involves, how trivial all such considerations become! We are here lifted into a region where our highest intelligence can only lead us to adoration, for we are gazing at a process in which the operations of Nature become one with the divine task of Creation.

FOOTNOTES:

[169] See, e.g., Groos, *Ästhetische Genuss*, p. 249. "We have to admit,"

Groos observes, "the entrance of another instinct, the impulse to tend and foster, so closely connected with the sexual life. It is seemingly due to the co-operation of this impulse that the little female bird during courtship is so often fed by the male like a young fledgling. In man 'love' from the biological standpoint is also an amalgamation of two needs; when the tender need to protect and foster and serve is lacking the emotion is not quite perfect. Heine's expression, 'With my mantle I protect you from the storm,' has always seemed to me very characteristic." Sometimes the sexual impulse may undergo a complete transformation in this direction. "I believe there is really a tendency in women," a lady writes in a letter, "to allow maternal feeling to take the place of sexual feeling. Very often a woman's feeling for her husband becomes this (though he may be twenty years older than herself); sometimes it does not, remaining purely sex feeling. Sometimes it is for some other man she has this curious self-obliterating maternal feeling. It is not necessarily connected with sex intercourse. A prostitute, who has relations with dozens of men, may have it for some feeble drunken fool, who perhaps goes after other women. I once saw the change from sex feeling to mother feeling, as I call it, come almost suddenly over a woman after she had lived about four years with a man who was unfaithful to her. Then, when all real sex feeling, the hatred of the woman he followed, the desire he should give her love and tenderness, had all gone, came the other feeling, and she said to me, 'You don't understand at all; he's

only my little baby; nothing he does can make any difference to me now.' As I grow older and understand women's natures better, I can see almost at once which relation it is a woman has to her husband, or any given man. It is this feeling, and not sex passion, that keeps woman from being free." Not only is there a sexual association in the impulse to foster and protect, there would appear to be a similar element also in the response to that impulse. Freud has especially insisted on the partly sexual character of the child's feelings for those who care for it and tend it and satisfy its needs. It is begun in earliest infancy; "whoever has seen the sated infant sink back from the breast, to fall asleep with flushed cheeks and happy smile, must say that the picture is adequate to the expression of the sexual satisfaction of later life." The lips, moreover, are the earliest erogenous zone. "There will, perhaps, be some opposition," Freud remarks (Drei Abhandlungen zur Sexualtheorie, pp. 36, 64), "to the identification of the child's feelings of tenderness and appreciation for those who tend it with sexual love, but I believe that exact psychological analysis will place the identity beyond doubt. The relationship of the child with the person who tends it is for it a continual source of sexual excitement and satisfaction flowing from the erogenous zones, especially since the fostering person--as a rule the mother--regards the child with emotions which proceed from her sexual life; strokes it, kisses it, rocks it, and very plainly treats it as a compensation for a fully valid sexual

object." Freud remarks that girls who retain the childish character of their love for their parents to adult age are apt to make cold wives and to be sexually anæsthetic.

[170] Esbach (in his *_Thèse de Paris_*, published in 1876) showed that even the finger nails are affected in pregnancy and become measurably thinner.

edition, pp. 344,
et seq.

[184] Arthur Giles, "The Longings of Pregnant Women,"
Transactions
Obstetrical Society of London, vol. xxxv, 1893.

[185] Ploss and Bartels, Das Weib, Chapter XXX.

[186] Thus, in Cornwall, "to be in the longing way" is a
popular synonym
for pregnancy.

[187] The apple, wherever it is known, has nearly always been a sacred or magic fruit (as J.F. Campbell shows, *Popular Tales of West Highlands*, vol. I, p. lxxv. et seq.), and the fruit of the forbidden tree which tempted Eve is always popularly imagined to be an apple. One may perhaps refer in this connection to the fact that at Rome and elsewhere the testicles have been called apples. I may add that we find a curious proof of the recognition of the feminine love of apples in an old Portuguese ballad, "Donna Guimar," in which a damsel puts on armour and goes to the wars; her sex is suspected and as a test, she is taken into an orchard, but Donna Guimar is too wary to fall into the trap, and turning away from the apples plucks a citron.

[188] A. Pinard, Art. "Grossesse," *Dictionnaire Encyclopédique des Sciences Médicales*, p. 138. On the subject of violent, criminal and abnormal impulses during pregnancy, see Cumston, "Pregnancy and Crime," *American Journal Obstetrics*, December, 1903.

[189] See especially Ploss and Bartels, *Das Weib*, vol. i, Chapter XXXI. Ballantyne in his work on the pathology of the foetus adds Loango negroes, the Eskimo and the ancient Japanese.

[190] In 1731 Schurig, in his *Syllepsilogia*, devoted more than a hundred pages (cap. IX) to summarizing a vast number of curious cases of maternal impressions leading to birth-marks of all kinds.

[191] J.W. Ballantyne has written an excellent history of the doctrine of

maternal impressions, reprinted in his Manual of Antenatal Pathology: The Embryo, 1904, Chapter IX; he gives a bibliography of 381 items. In Germany the history of the question has been written by Dr. Iwan Bloch (under the pseudonym of Gerhard von Welsenburg), Das Versehen der Frauen, 1899. Cf., in French, G. Variot, "Origine des Préjugés Populaires sur les Envies," Bulletin Société d'Anthropologie, Paris, June 18, 1891. Variot rejects the doctrine absolutely, Bloch accepts it, Ballantyne speaks cautiously.

[192] J.G. Kiernan has shown how many of the alleged cases are negatived by the failure to take this fact into consideration. (Journal of American Medical Association, December 9, 1899.)

[193] J. Clifton Edgar, The Practice of Obstetrics, second edition, 1904, p. 296. In an important discussion of the question at the American Gynæcological Society in 1886, introduced by Fordyce Barker, various eminent gynæcologists declared in favor of the doctrine, more or less cautiously. (Transactions of the American Gynæcological Society, vol. xi, 1886, pp. 152-196.) Gould and Pyle, bringing forward some of the data on the question (Anomalies and Curiosities of Medicine, pp. 81, et seq.) state that the reality of the influence of maternal impressions seems fully established. On the other side, see G.W. Cook, American Journal of Obstetrics, September, 1889, and H.F. Lewis, ib., July, 1899.

[194] Transactions Edinburgh Obstetrical Society, vol. xvii, 1892.

[195] J.W. Ballantyne, Manual of Antenatal Pathology: The Embryo, p. 45.

[196] W.C. Dabney, "Maternal Impressions," Keating's Cyclopædia of Diseases of Children, vol. i, 1889, pp. 191-216.

[197] Féré, Sensation et Mouvement, Chapter XIV, "Sur la Psychologie du Foetus."

[198] J. Thomson, "Defective Co-ordination in Utero," British Medical Journal, September 6, 1902.

[199] H. Campbell, Nervous Organization of Man and Woman, p. 206; cf. Moll, Untersuchungen über die Libido Sexualis, bd. i, p. 264. Many authorities, from Soranus of Ephesus onward, consider, however, that sexual relations should cease during pregnancy, and certainly during the later months. Cf. Brénot, De l'influence de la copulation pendant la grossesse, 1903.

[200] Bianchi terms this fairly common condition the neurasthenia of pregnancy.

[201] Vinay, Traité des Maladies de la Grossesse, 1894, pp. 51, 577; Mongeri, "Nervenkrankungen und Schwangerschaft." Allgemeine Zeitschrift für Psychiatrie, bd. LVIII, Heft 5. Haig remarks (Uric Acid, sixth edition, p. 151) that during normal pregnancy diseases with excess of uric acid in the blood (headaches, fits, mental depression, dyspepsia, asthma) are absent, and considers that the common idea that women do not easily take colds, fevers, etc., at this time is well founded.

[202] Founding his remarks on certain anatomical changes and on a suggestion of Engel's, Donaldson observes: "It is impossible to escape the conclusion that in women natural education is complete only with maternity, which we know to effect some slight changes in the sympathetic system and possibly the spinal cord, and which may be fairly laid under suspicion of causing more structural modifications than are at present recognized." H.H. Donaldson, *The Growth of the Brain*, p. 352.

[203] The state of menstruation is in many respects an approximation to that of pregnancy; see, e.g., Edgar's *Practice of Obstetrics*, plates 6 6 and 7, showing the resemblance of the menstrual changes in the breasts and the external sexual parts to the changes of pregnancy; cf. Havelock Ellis, *Man and Woman*, fourth edition, Chapter XI, "The Functional Periodicity of Woman."

[204] Thus the gypsies say of an unmarried woman who becomes pregnant, "She has smelt the moon-flower"--a flower believed to grow on the so-called moon-mountain and to possess the property of impregnating by its smell. Ploss and Bartels, *Das Weib*, bd. I, Chapter XXVII.

[205] This was a sound instinct, for it is now recognized as an extremely important part of puericulture that a woman should rest at all events during the latter part of pregnancy; see, e.g., Pinard, *Gazette des Hôpitaux*, November 28, 1895, and *Annales de Gynécologie*, August, 1898.

[206] Ploss and Bartels, op. cit., Chapter XXIX;
Kryptadia, vol. viii, p.
143.

[207] Griffith Wilkin, British Medical Journal, April
8, 1905.

[208] Weininger, Geschlecht und Charakter, p. 107. I
may remark that a
recent book, Ellis Meredith's Heart of My Heart, is
devoted to a
seemingly autobiographical account of a pregnant woman's
emotions and
ideas. The relations of maternity to intellectual work
have been carefully
and impartially investigated by Adele Gerhard and Helena
Simon, who seem
to conclude that the conflict between the inevitable
claims of maternity
and the scarcely less inevitable claims of the
intellectual life cannot be
avoided.

APPENDIX.

HISTORIES OF SEXUAL DEVELOPMENT.

HISTORY I.--The following narrative has been written
by a
university man trained in psychology:--

So far as I have been able to learn, none of my
ancestors for at
least three generations have suffered from any
nervous or mental
disease; and of those more remote I can learn
nothing at all. It
appears probable, then, that any peculiarities of my
own sexual
development must be explained by reference to the
somewhat

peculiar environment.

I was the first child and was, naturally, somewhat spoiled--a process which tended to increase my natural tendency to sentimentality. On the other hand, I was shy and undemonstrative with all except my nearest relatives, and with them as well after my seventh or eighth year. And here it may be well to describe my "mental type," as this is probably the most important factor in determining the direction of one's mental development. Of mental types the "visual" is, of course, by far the most common, but in my own case visual imagery was never strong or vivid, and has constantly grown weaker. The dominant part has been played by tactual, muscular and organic sensations, placing me as one of the "tactual motor" type, with strong "verbal motor" and "organic" tendencies. In reading a novel I seldom have a mental picture of the character or situation, but easily imagine the sensations (except the visual) and feel something of the emotions described. When telling of any event I have a strong impulse to make the movements described and to gesticulate. I remember events in terms of movements and the words to be used in giving an account of them; and in thinking of any subject I can feel the movements of the larynx and, in a less degree, of the lips and tongue that would be involved in putting my thoughts into words. I am easily moved to emotion, even to

sentimentality, but am
seldom if ever deeply affected and am so averse to
any display of
my feelings that I have the reputation among my
acquaintances of
being cold, unfeeling and unemotional. I am
naturally quiet and
bashful to a degree, which has rendered all forms of
social
intercourse painful through much of my life, and
this in spite of
a real longing to associate with people on terms of
intimacy. As
a child I was sensitive and solitary; later I became
morbid as
well. In a character so constituted the feelings and
impulses of
the moment are likely to rule, and such has been my
constant
experience, though a large element of obstinacy in
my character
has kept me from appearing impulsive, and slight
influences will
bring about reactions which seem out of all
proportion to their
cause. For instance, I cannot, even now, read the
more erotic of
Boccaccio's stories without a good deal of sexual
excitement and
restlessness, which can be relieved only by vigorous
exercise or
masturbation.

The first ten years of my life were passed on a
farm, most of the
time without playmates or companions of my own age.

As far back as I can remember I indulged in
elaborate day-dreams
in which I figured as the chief character along with
a few others
who were chiefly creatures of my imagination, but at
times
borrowed from reality. These others were always boys
until I

learned the proper function of the sexual organs,
when girls
usurped the whole stage in numbers beyond the limits
of a Turkish
harem. Even at school my day-dreams were scarcely
interrupted,
for my shyness and timidity made me very unpopular
among my
schoolmates, who tormented me after the fashion of
small boys or
neglected me, as the spirit moved them. To make
matters worse, I
was brought up under the "sheltered life system,"
kept carefully
away from the "bad boys," which category included
nearly all the
youngsters of the community, and deluged with moral
homilies and
tirades on things religious until I was thoroughly
convinced that
goodness and discomfort, the right and the
unpleasant, were
strictly synonymous; and I was kept through much of
the time
facing the prospect of an early death, to be
followed by the good
old orthodox hell or the equal miseries of its
gorgeous
alternative. I may say in all seriousness that this
is a
conservative and unexaggerated account of one phase
of my early
life--the one, I think, that tended most strongly to
make me
introspective and morbid. Later on, when I was
trying to abandon
the habit of masturbation, this early training
greatly increased
the despair I felt at each successive failure.

The first traces of sexual excitement that I can now
recall
occurred when I was about 4 years old. I had
erections quite
frequently and found a mild pleasure in fondling my

genitals when

these occurred, especially just after waking in the morning. I

had no notion of an orgasm, and never succeeded in producing one

until I was 13 years of age. In the summer of my sixth year I

experienced pleasurable sensations in daubing my genitals with

oil and then fondling or rubbing them, but I abandoned this

amusement after getting some irritating substance into the

meatus. A year later my mother warned me that playing with my

penis would "make me very sick," but since experience had taught

me that this was not true, my conviction that what was forbidden

must necessarily be pleasant, sent me directly to my favorite

retreat in the barn loft to experiment. Since, however, I failed,

in spite of persistent effort, to produce any such pleasant

results as I had expected, I soon gave up my attempts for other

kinds of amusement.

A few months after this, in midsummer, a very sensual servant

girl began a series of attempts to satisfy herself sexually with

my help. She came nearly every day into the loft where I was

playing and did her best to initiate me into the mysteries of

sexual relationships, but I proved a sorry pupil. She would rub

my penis until it became erect and then, placing me upon her,

would insert the penis in her vulva and make movements of her

thighs and hips calculated to cause friction. At times she varied

the program by lying upon me and embracing me passionately. I can remember distinctly her quick, gasping breath and convulsive movements. She generally ended the seance by persuading me to perform cunnilingus upon her. None of these performances were intelligible to me and I invariably protested against being compelled to leave my play to amuse her. Even her fondling of my genitals annoyed me; and, stranger still, I preferred satisfying her by cunnilingus to the attempts at coitus.

It was nearly a year later that I experienced the first unmistakable manifestations of the sexual impulse--erectations accompanied by lustful feeling and vague desires of whose proper satisfaction I had no notion whatever. It never occurred to me to associate my experiences with the servant girl with these new sensations. The peculiar fact about them was that they were generally occasioned by the infliction of pain upon animals. I do not remember how I first discovered that they could be evoked in this way, but I can clearly recollect many of my efforts to arouse this pleasurable excitement by abusing the dog or the cats, or by prodding the calves with a nail set in the end of a broom handle. I seldom manipulated my genitals at this time, and when I did it was for the purpose of causing sexual excitement rather than allaying it.

During this same year I got my first idea of sexual

intercourse

by watching animals copulate; but my powers of observation must

have been limited, for I supposed that the penis of the male

entered the anus of the female. In watching the coitus of animals

I experienced lively sexual excitement and lustful sensations,

located not only in the genitals, but apparently in the anus as

well. I often excited, myself by imagining myself playing the

part of the female animal--a peculiar combination of passive

pederasty and bestiality. A servant girl put me to right on the

error of observation just mentioned, but neglected to apply the

principle to human animals, and I remained for another year in

complete ignorance of the structure of woman's sexual organs and

of the intercourse between man and woman. In the meantime I

cultivated my fancies of intercourse with animals, often still

perversely imagining myself taking the part of the female; and

the notion of such relationships gradually became so familiar as

to seem possible and desirable. This is especially significant in

view of later developments.

Up to my eleventh or twelfth year the erotic element in my

daydreaming varied with the seasons. In the summer it played a

dominant part, while in the winter it was almost entirely absent,

owing, it may be, to the fact that most of my time was spent

indoors or on long, tiresome tramps to and from school, and the

further fact that during the winter I saw but little of the animals which had acted as a stimulus to sexual excitement. So little was I troubled in winter and so ignorant was I of normal intercourse that sleeping with a cousin, a girl of about my own age (7 or 8 years), resulted in no addition to my knowledge of things sexual.

It was early in my ninth year that I first learned something of the anatomical difference between man and woman and of the functions of the sexual organs in coitus. These were explained to me by a young male servant, who, however, told me nothing of conception or pregnancy. At first I was very little interested, as it did not immediately occur to me to associate my own erotic experiences with the matter of these revelations; but under the faithful tuition of my new instructor I soon began to desire normal coitus, and my interest in the sexual affairs of animals weakened accordingly. His teachings went still further, for he masturbated before me, then persuaded me to masturbate him, and finally practiced coitus inter femora upon me. He also tried to masturbate me, but was unable to produce an orgasm, though I found the experiment mildly pleasurable.

Early in my eleventh year we left the farm and lived in the city for several months. In the meantime there had been no developments in my sexual life beyond what has

already been

indicated. In the city I found so much to interest
and amuse me

that I almost entirely forgot my erotic day-dreams
and desires.

Though my chief playmates were two girls of about my
own age I

never thought of attempting sexual intercourse with
them, as I

might easily have done, for they were much wiser and
more

experienced in these things than myself. Shortly
before the end

of our stay in town an older schoolmate explained to
me as much

of the process of reproduction as is usually known
by a

precocious youngster of 12 years, but I firmly
refused to credit

his statements. He adduced the fact of lactation in
proof of the

correctness of his views, but I had been too
thoroughly steeped

in supernaturalism to be very amenable to
naturalistic evidence

of this sort and remained obdurate. But the
suggestion stayed

with me and perplexed me not a little; when we
returned to the

farm I began to watch the reproductive process in
animals.

The following two years were decidedly unpleasant. I
was growing

rapidly and was sluggish, awkward and stupid. At
school I was

more unpopular than ever and seemed to have a
positive genius

for doing the wrong thing. On the rare occasions
when my

companions admitted me to their counsels I was a
willing dupe and

catpaw, with the result that I was much in trouble
with my

teachers. Being morbidly sensitive I suffered keenly

under these
circumstances and, as my health was not at all good,
I often made
of my frequent headaches excuses to stay at home,
where I would
lie abed brooding over my small troubles or, more
often, dreaming
erotic day-dreams and making repeated attempts to
produce an
orgasm. But though these efforts were accompanied by
the most
lustful thoughts and my imagination created
situations of
oriental extravagance, I was 13 years old when they
first met
with success. I remember the occasion very
distinctly, the more
so because I thought of it much and bitterly when
shortly
afterwards I tried to abandon a habit which the
family "doctor
book" assured me must result in every variety of
damnation. At
the moment, however, I was greatly surprised and
gratified and
tried at once to repeat the delightful sensation,
but was unable
to do so until the following day. From that time to
the present I
think I have masturbated an average of ten times per
week, and
this is certainly a very conservative estimate; for
though up to
my sixteenth year I could seldom produce an orgasm
more than once
a day I have often, during the last four or five
years, produced
it from four to seven times per day without
difficulty and this
for days and even weeks in succession. During these
periods of
excessive masturbation very little liquid was
ejaculated and the
pleasurable sensations were slight or entirely
lacking.

From the time when I began masturbating regularly practically my whole interest centered in things pertaining to sex. I read the chapters of the family "doctor book" which treated of sexual matters; my day-dreams were almost exclusively erotic; I sought opportunities to talk about sex-relationships with my schoolmates, with whom I was now slowly getting on better terms; I collected pictures of nude women, learned a great number of obscene stories, read such obscene books as I could obtain and even searched the dictionary for words having a sexual connotation. Up to my fifteenth year, when ejaculation of semen began, there was a strong sadistic coloring to my day-dreams. Through this period, too, my bashfulness in the presence of the opposite sex increased until it reached the point of absurdity.

When fifteen years old I began to practice coitus inter femora on my brother and continued it intermittently for about two years. The experience was disappointing, for I had confidently expected a great increase of pleasure over masturbation in this act; and in casting about for some stronger stimulus I recurred to the forgotten idea of intercourse with animals. I promptly tried to put the idea to a test, but failed several times, and finally succeeded, only to find that the result fell far short of my expectations. Nevertheless I continued the practice

irregularly

for about three years--or rather through that part of the three

years that I spent at home, for while I was at school opportunity

for such indulgence was lacking. Long familiarity with the idea

of intercourse with animals had made it impossible for me to feel

the disgust with the practice which it inspires in most people;

and even the perusal of Exodus xxii: 19 failed to make me abandon

it. Firmly as I believed in the Mosaic law the supremacy of the

sexual impulse was complete.

As early as my sixteenth year I tried to abandon "self-abuse" in

all its forms and have repeatedly made the same effort since that

time but never with more than very partial success.

On two or

three occasions I have stopped for periods of several weeks, but

only to begin again and indulge more recklessly than before. The

deep depression which followed each failure, and often each act

of masturbation, I attributed solely to the loss of semen,

leaving out of account the fact that I expected to feel depressed

and the utter discouragement and self-contempt which accompanied

the sense of failure and weakness when, in the face of my

resolution, I repeatedly gave way and yielded to the temptation

to an act whose consequences I firmly believed must be ruinous. I

am now convinced that by far the greater part of this depression

was due to suggestion and the humiliating sense of defeat. And

this feeling of moral impotence, this seeming helplessness against an overpowering impulse which, on the other hand, seemed so trivial when viewed without passion, eventually weakened my self-control to a degree guessed by no one but myself and sapped the foundations of my moral life in a way which I have constant occasion to deplore.

The foregoing paragraphs give, I think, a fair idea of my condition when I left home for a boarding school at the beginning of my seventeenth year. From this time my experiences may be said to have run on in two distinct cycles--that of the summer months when I was at home, and that of the remainder of the year when I was at school. This fact will make some confusion and apparent inconsistency in the rest of this "history" unavoidable. When I left home I was shy, retiring, totally ignorant of social usage, without self-confidence, unambitious, dreamy, and subject to fits of melancholy. I masturbated at least once a day, though I was in almost constant rebellion against the habit. In my more idle moments I elaborated erotic day dreams in which there was a peculiar mixture of the purely sensual and the purely ideal element; which never fused in my experience, but held the field alternately or mingled somewhat in the manner of air and water. One person usually served as the object of my ideal attachment, another as the center round which I grouped my

sensual dreams and
desires.

At school I found more congenial companions than I had fallen in with elsewhere, and the necessary contact with people of both sexes gradually wore off some of the rougher corners and brought a measure of self-confidence. I had two or three incipient love affairs which my backwardness kept from growing serious. Out of this change of environment came a sense of expansion, of escape from self, which was distinctly pleasant. I still masturbated regularly, but no longer experienced the former depression except when at home during vacation. Relatively to the past, life was now so varied and interesting that I had less and less time for melancholy; and the discovery that I could lead my classes and hold my own in athletic sports seemed to indicate that my past fears had been exaggerated. Nevertheless I was never reconciled to the habit and often rebelled at the weakness that kept me its slave.

When I entered the university the effects of my useless struggle with the practice of masturbation were pretty well developed. I could no longer fix my attention steadily upon my work and found that only by "cribbing" and "bluffing" could I keep my place at the head of my classes. I was troubled not a little by the shoddiness of my work, and tried again and again during the

course of the two years spent at this college to shake off the habit. At the university I was introduced gradually to a wider social circle and so far outgrew my bashfulness that I began to seek the society of the opposite sex assiduously. As I gained self-confidence I became reckless, getting at one time into serious trouble with the authorities which came near resulting in my expulsion. I became one of the more popular members of the clique to which I belonged--much to my surprise and even more to that of my acquaintances. The physical culture craze attacked me at this time and my pet ambition was the attainment of strength and agility. My bump of vanity also grew apace, but an unmeasured hatred of all kinds of foppishness kept me on the safe side of moderation in my dress and behavior.

During my second year of university life I had two love affairs in the course of which I found that my interest in any particular member of the fair sex disappeared as soon as it was returned.

The pursuit was fascinating enough, but I cared nothing at all for the prize when once it was within reach. I may add that the interest I had in the girls was purely ideal. While at this school I do not think I masturbated half as often as while at the preparatory school.

When I left this college for ---- University I took with me a formidable catalogue of good resolutions, first

among which was
the determination to abandon all kinds of "self-abuse." I think I
kept this one about a month. As I had gone from a comparatively
small school to one of the largest of American universities the
change was great and the revelations it brought me frequently
humiliating. I was lonesome, home-sick, and my bump
of
self-esteem was woefully bruised; and not
unnaturally I soon
began to seek a partial solace in day-dreams and masturbation.
After I had become somewhat adapted to my new environment I
indulged less frequently in either, and from that time to the
present I have masturbated very irregularly, sometimes but little
and again to excess.

Not long after I came to this place I met a young lady with whom
I soon became quite intimate. For over a year our friendship was
strictly platonic and then swung suddenly around to a sexual
basis. We were ardent lovers for a few weeks, after which I tired
of the game as I had before in other cases, and broke off all
relations with her as abruptly as was possible. Since then I have
almost wholly withdrawn from the society and companionship of
women and have almost entirely lost whatever tact and assurance I
once possessed in their company. Things pertaining to sexual life
have interested me rather more than less, but have occupied my
attention much less exclusively than before this episode. Though

I have never intended to marry, my breaking off relations with this girl affected me much. At any rate it marked an abrupt change in the character of my sexual experiences. The sexual impulse seems to have lost its power to rouse me to action. Hitherto I had practiced masturbation always under protest, as it were--as the only available form of sexual satisfaction; while now I resigned myself to it as all that there was to hope for in that field. Of course I knew that a little effort or a little money would procure natural satisfaction of my sexual needs, but I also knew that I would never, under any ordinary circumstances, put forth the necessary effort, and fear of venereal disease has been more than enough to keep me away from houses of prostitution.

Some months ago I refrained from masturbation for a period of about six weeks and watched carefully for any change in my health or spirits, but noticed none at all. The only impulse to masturbate was occasioned by fits of restlessness accompanied by erections and a mildly pleasurable feeling of fullness in the penis and scrotum. I think that over 75 per cent, of my acts of masturbation are provoked by these fits of restlessness and are unaccompanied by fancy images, erotic thoughts, lustful desires, or marked pleasure. At other times the act is occasioned by erotic thoughts and images, and is accompanied by a considerable

degree of lustful pleasure which, however, is never so intense as in my earlier experiences and has steadily decreased from the first. Usually the orgasm is accompanied by a strong contraction of all the voluntary muscles, particularly the extensors, followed by a slight giddiness and slight feeling of exhaustion. If repeated several times in the course of a single day the acts are followed by dullness and lassitude; otherwise the feeling of exhaustion passes away quickly and a sense of relief and quiet takes its place. So natural or rather habitual has this resort to masturbation as a means of relief from nervousness and restlessness become that the act is almost instinctive in its unconsciousness.

I am extremely sensitive to all kinds of sexual influences, and have an insatiable curiosity regarding everything that pertains to the sexual life of men or women. I am not, however, excited sexually by conversation about sexual facts and relationships, no matter what its nature, though in reading erotic literature my excitement is often intense.

The tendency to day dream has never left me, but there are no longer any elaborate scenes or long-continued "stories," these having been replaced by vaguely imagined incidents which are usually broken off before they reach a satisfactory climax. They are always interrupted by the intrusion of other

matters, usually
of more practical interest; and the long-continued
habit of
satisfying myself by masturbation has made erotic
dreams rather
tantalizing than pleasurable. I dream very seldom at
night--at
least I can scarcely ever remember any dreams upon
waking--and
practically never of sexual relations. I have not
had a nocturnal
emission for over three years, and probably not more
than
twenty-five in my life.

In my "love passages" with girls there has been no
serious
thought of coitus on my part, and I have never had
intercourse
with a woman--unless my early experiences with the
servant girl
be called such. Like all masturbators I always
idealized "love"
to the utter exclusion of all sensual cravings; and
the notion
that the physical act of coitus was something
degrading and
destructive of real love rather than its
consummation was, of all
prejudices I have ever formed, the most difficult to
escape--a
circumstance due, I suppose, to the fact that all I
had ever been
taught on the subject tended to the complete divorce
of what was
called "love" from what was stigmatized as a "base
sensual
desire." Judging from my own experience and
observation I should
say that "ideal love" is a mere surface feeling,
bound to
disappear as soon as it has gained its object by
arousing a
reciprocal interest on the part of the one to whom
it is

directed. So little did I "materialize" the objects of my "love"

that I have never cared for kissing or the warm embraces in which

lovers usually indulge. I have never kissed but one girl, and her

with far too little enthusiasm to satisfy her. My last sweetheart

was a very passionate girl, the warmth of whose embraces was

somewhat torrid and, to me, both puzzling and annoying. The

intensity of feeling which demanded such strenuous expression was

beyond my knowledge of human nature. A somewhat peculiar

circumstance in connection with these experiences is the fact

that I often found myself trying to analyze my emotions with a

purely psychological interest while playing the part of the

intoxicated lover in his mistress's arms.

There is but little left to say on the subject of my sexual

development. During the last two or three years my knowledge of

the facts of the sexual life has been very greatly increased,

and I have become acquainted with phases of human nature which

were wholly unknown to me before. The part played by things

sexual in my life is still, I suppose, abnormally large; it is

undoubtedly the largest single interest, though my outer life is

determined almost wholly by other considerations.

Of course I know nothing of the effect which long-continued

masturbation may have had on my ability to perform normal coitus.

I do not think I am subject to any kind of sexual

perversion, for

all my indulgence has been _faute de mieux_ and, at least since I

began masturbation, all my desires and erotic day-dreams have had

to do only with normal coitus. The mystery which surrounds the

sexual act seems at times to be regaining its former influence

and power of fascination. I have no doubt, however, but that I

should be greatly disillusioned should I ever perform coitus; and

I greatly regret that I have not been able to test this

conviction and so round out and complete this "history."

It may be worth while to say a word about my religious

experiences, as, in many cases, they are closely bound up with

the sexual impulse. I was never "converted," but on a dozen or

more occasions approached the crisis more or less closely. The

dominant emotion in these experiences was always fear, sometimes

with anger and despair intermixed in varying proportions. A

complete analysis of these experiences is, of course, impossible,

but the various pleasurable feelings of which converts spoke in

the revivals which I attended were a closed book to me. Following

my revival-meeting experiences came a few days spent in a sort of

moral exaltation during which I eschewed all my habits of which

conventional morality disapproved, save masturbation, and felt no

small satisfaction with my moral conditions. I became a

first-rate Pharisee. Toward the women who had

figured in my day
dreams I suddenly conceived the chastest affection,
resolutely
smothering every sensual thought and fancy when
thinking of them,
and putting in place of these elements ideal love,
self-sacrifice, knightly devotion--Sunday-school
Garden-of-Eden
pictures with a mediæval, romantic coloring. These
day-dreams
were always sexual, involving situations of extreme
complexity
and monumental silliness. Masturbation was always
continued and
usually with increased frequency. The end of these
periods was
always abrupt and much like awaking from a dream in
which the
dreamer has been behaving in a manner to arouse his
own disgust.
They were followed by feelings of sheepishness and
self-contempt
mingled with anger and a dislike of all things
having to do with
religion. My inability to pass the conversion crisis
and a
growing contempt for empty enthusiasm finally led me
to a saner
attitude toward religion, from which I passed easily
into
religious scepticism; and later the study of
philosophy and
science, and particularly of psychology, banished
the last
lingering remnant of faith in a supernatural agency
and led me
to the passion for facts and indifference to values
which have
caused me to be often called "dead to all morality."

HISTORY II.--C.A., aged 25, unmarried; tutor,
preparing to take
Holy Orders:--

My paternal ancestry (which is largely Huguenot) is noteworthy

for its patriotism and its large families. My father, who died

when I was a year old, is remembered for the singular uprightness

and purity of his life from his earliest childhood. The

photograph which I have shows him as possessed of a rare classic

beauty of features. He was an ideal husband and father. At the

time of his death he was a Master of Arts and a school principal.

My mother is an extraordinarily neurotic woman, yet famed among

her friends for her great domesticity, attachment to her

husbands, and an almost abnormal love of babies. She has nobly

borne the ill-treatment of her second husband, who for several

years has been in a state of melancholia. My mother has been

"highly-wrought" all her life, and has suffered intensely from

fears of all kinds. As a young girl she was somnambulistic, and

once fell down a stairhead during sleep. In spite of her bodily

sufferings with indigestion, eye-strain, and depression she

retains her youthfulness. She has slight powers of reasoning. She

has had times of unconsciousness and rigidity, I have never heard

any mention of epilepsy. She has a horror of showing prudishness

in regard to the healthful manifestations of sex life, and is

always praising examples of what she terms "a natural woman."

I have heard that during my first year my mother detected my

nurse in the act of putting a morphine powder on my tongue for the purpose of keeping me quiet. I was subject to convulsions at this period, and narrowly escaped a permanent hernia. My family tell me that from the beginning I was a well-developed and boyish boy, full of mischief, impulsive, good to look upon, unusually affectionate, beloved by all.

In my third year I took pleasure in crawling under the bed with my boy-cousin who was nine months my senior, and after we had taken down our drawers, in kissing each other's nates. I do not remember which of us first thought of this pastime.

At the age of 4 I gave myself a treat by gazing upward through a cellar window at the nates of a woman who was defecating from several feet above into a cesspool that lay beneath. It was during this summer also that I frightened myself by pulling back my prepuce far enough to disclose the purple glans, which I had never seen before. But this act gave me no desire to masturbate.

When 5 years old, and living in a great city, I drew indecent pictures in company with a little girl and her younger brother.

These pictures represented men in the act of urinating. The penes were drawn large, and the streams of urine plainly indicated. One afternoon I induced the boy to go to the bath-room, lie on his back, and allow me to perform _fellatio_ on

him. I did not ask him to return the favor. I remember the curious tar-like smell of his clothing and the region about his genitals. It is possible that I gained my knowledge of _fellatio_ from an unknown boy of 10, who had induced me, during the preceding summer to enter a sandy lot with him, watch him urinate, and then, kneeling before him, commit _fellatio_. A year later, as I was walking home in the rain to our summer cottage, with an open umbrella over my shoulder, a boy of 15, who was leaning against our fence, exhibited a large, erect penis, and when I had passed him urinated upon me and my umbrella. I never saw the boy again. I felt peculiarly insulted by his act. Back of the house there lived a 12-year-old boy who invited me to watch him defecate in the outdoor privy, and during the act told me a number of indecent stories and words which I cannot remember.

About this time I fell in love with a little Jewish boy next door. Often I cried myself to sleep over the thought that perhaps he was lying on a sofa alone and crying with a stomach-ache. I longed to embrace him; and yet I saw little of him, and made little of him when I was with him.

Living in a Western city a few months later, some girls of 12 and 14 led me to their barn, where they dressed themselves in boys' clothing and made believe that they were cowboys. One of them

told me to "shut my eyes, open my mouth, and get a surprise."

When I opened my eyes once more a piece of hen-dung lay in my

mouth. I have a vague remembrance of one of the girls asking me

to enter a water-closet with her. She uttered some indelicate

phrase, but I performed no act with her. In the house where I

lived I once entered the bedroom of a half-grown girl while she

was dressing. She knelt to kiss me innocently enough, and I, by a

sudden impulse, ran my hand between her bare neck and her corset

as far as I could reach. Apparently she took no notice of my

movement. Although I did not masturbate, yet during this winter I

experienced a tickling sensation about my genitals when I placed

my hand beneath them as I lay on my stomach in bed. One evening I

pulled up my night-dress and, holding my penis in my hand, I

danced to and fro on the carpet. I imagined that I was one of a

line of naked men and women who were advancing toward another

similar line that faced them. I imagined myself as pleausurably

coming in contact with my female partner who possessed male genitals.

The following summer I lived in the woods. My next-door playmate

was a little girl of my own age--6 years. She sat down before me

in the barn and exposed her genitals. This was the first time I

had seen female organs, or had thought for a moment that they

differed from my own. In great perplexity I asked

the little
girl: "Has it been cut off?" She and I defecated in
peach baskets
that we found in the upper part of the barn.

When I was 7 years old and back in the Eastern city
I lived in
the house of a physician. Alone with his 3-year-old
daughter one
day, I showed her my erect organ, and felt a
delicious
gratification when she stroked it with the words:
"Nice! Nice!" I
confessed my fault to my guardian that night after I
had said my
prayers. I had complained to my mother a year before
of the
inconvenience I found in my penis being "so long
sometimes." She
said that she would "see about having the end taken
off." But I
was never circumcised. Her words gave me the doubly
unpleasant
impression that my glans was to be cut off.

There came occasionally to the kitchen of Dr. W.'s
house a
foul-mouthed Irish laundress who used coarse
language to me
concerning urination. I loathed the woman, and yet
one night I
dreamed that I was embracing her naked form and
rolling over and
over with her on the bed; and in spite of my sight
of female
genitals a few months before, I thought of her as
having organs
of my own kind and size. At my first school I
watched a
red-haired boy of 12 expose the penis of a 7-year-
old boy as he
lay on his back in the bath-room. I do not remember
that the
sight gave me sexual pleasure.

I spent the summer before I was 8 in a double house. The adopted daughter of our neighbor (a neurotic, retired physician) was a girl of 13 who had been taken from a poor laboring family. She got me to show her my parts, touched them, and asked whether I urinated from my scrotum. She also induced me to play with her genitals as we sat on a sofa in the twilight, and to spank her naked nates with the back of a hair-brush as she lay on a bed; but from none of these performances did I derive physical satisfaction. The girl E. and I took delight in "talking dirty secrets," as she expressed it. Her young cousin H. (nephew of her adopted mother) never heard me use the word "thing" without suggestively smiling. E. recalled the pleasant hours that she had spent with her cousin when they were in their night-gowns. She did not particularize these sexual relations. Under the board-walk the boy H. and I once defecated in bottles. Some little girls who lived opposite us pulled up their dresses one night and "dared" each other to dance out beyond the end of the house, in full view of the road. We boys merely looked on.

I now fell passionately in love with a remarkably handsome little boy of my own age. I longed to kiss and hug him, but I did not dare to do so, for he was haughty and intolerant of my attentions. I even allowed him to stand with one foot on me and

remark in a loud tone: "I am Conqueror!" I endured no end of petty insults and much ill-treatment from this boy. I reached the height of my passion on the night that he appeared at our cottage in a tight-fitting suit of pepper-and-salt. I gloried in his perfect legs and besought my guardian that she would buy me a similar suit of clothes.

For the summer after I was 8 years old I lived in a cottage in a country town. The servant maid M. was a young girl of 16 who listened eagerly to my accounts of the "secrets" and actions in which the girl E. and I had taken delight a year before. I think that M. arranged a meeting between a little black-haired girl and me in order that we might take a walk and play sexually with each other. Just as we were starting on our walk one of my relatives said that I must not leave the yard.

The little girl and I had see-sawed together and I had been interested in her legs as she rose in the air. (When I was 13 years old and see-sawing at a picnic with a stout girl, the motion of the board and the sight of her straddled form filled me with longing to embrace her sexually.) One afternoon M. took me to the house of an acquaintance of hers. M's brother was in the room and made a number of unremembered remarks which struck me as being rather "free," and M. told me later that she and the girl once dressed as ballet dancers and danced before

M.'s brother. I

felt that he was lascivious. I was always remarkably intuitive.

I fell in love with a handsome, stout, black-haired boy who lived

on a farm; but he was not a "farmer's son" in the common sense of

the word. I visited him for two or three days, and we slept with

each other, to my boundless joy. For his freckled girl cousin I

did not care the turn of my wrist, although she was a nice enough

little thing. One night when we three lay on a bed in the dark,

and neither of us boys had eyes or words for her, she silently

left us. He and I never committed the slightest sexual fault. I

left him with tears at the summer-end, and I often kissed his

photograph during the following winter.

In the flat-house where I began to live when I was 8 years old, I

once practiced mutual tickling of a very slight character with a

boy of my own age. We sat on chairs placed opposite to each other

and we inserted our fingers through the openings in our trousers.

Just as we were beginning to enjoy the titillation we were

interrupted by the approach of one of my family who, however, was

not quick enough to discover us. Down cellar I often saw the

genitals of the janitor's little girls--they were fond of lifting

their skirts and they did not wear drawers--but I had no desire

to attempt conjunction. I once caught an older friend of mine (he

was 13) in the act of leaving one of the girls. The

pair had been
in a coal-compartment. The boy was buttoning his
trousers and I
guessed what he had been doing. When I began to
sleep alone in my
tenth year I had no desire to masturbate, and was
loath to do so
by reason of ample warnings given me by my guardian
and by the
family physician. One afternoon a stunted friend of
mine sat down
in the back yard and astonished me by tying a piece
of string to
his penis. At a large private school which I now
attended I made
the acquaintance of the principal's son, and
wondered why he had
such a fancy for dressing his 5-year-old sister in
boy's clothes.
He closed the door on me while he was thus engaged.
At my house
we went to the bath-room together, and he showed me
his
circumcised and much-ridged penis. Neither of us
made any mention
of masturbating.

At this period I fell slightly in love with a 5-
year-old boy with
intensely black eyes. I would kiss him whenever we
were alone,
but I had no wish to seduce him. I was always
interested in
watching the urination of younger children. When I
was 5 years
old I went on my knees to a strange little boy in
order to
whisper in his ear an inquiry as to whether he
wanted to urinate.
I experienced a pleasurable thrill when I was 10
years old in
leading a small girl cousin to the outdoor privy, in
helping her
on and off the open seat, in buttoning and
unbuttoning her

drawers, and in gazing at her vulva.

The summer before I was 10 I lived a wild life in the mountains.

My companions were a negro girl, the two daughters of a

clergyman, the two sons of a questionable woman hotel-keeper, and

the daughter of the Irish scavenger. All of these children were

extraordinarily sensual. Their leading pastime, from morning

until night, was varying forms of indecency, with the supreme

caress--which they termed "raising dickie"--as the most frequent

enjoyment. The 5-year-old daughter of the scavenger explained to

us how she had seen her father approaching her stout mother with

an erect penis, the pair standing up before the lamplight during

the act. This curly-headed, rosy-cheeked child handled her

genitals so much that they were inflamed. I once saw her sitting

in the road and rubbing dust against her vulva. I saw little of

the elder daughter of the minister (she was 12 years old). She

persuaded me to expose myself before her in the cellar of a

partially-built house. In return for my favor she allowed me to

look at her genitals. She did not ask for _conjunctio_. The two

younger daughters were my intimates. With the middle one I was

forever performing a weak conjunction that consisted in the

laying of my member against her vulva.

Notwithstanding all the

entreaties of my little friend, I could not be persuaded to

protrude my penis against her vagina; and not on one

occasion can

I remember obtaining an erection or extreme pleasure. Up in the garret she straddled slanting beams with her genitals exposed, and I followed her example. The negro girl and my little friend both urinated on a tent floor at my request. I did not fancy the odor of a girl's genitals, nor the appearance of the vulva when the labia were held apart.

The following summer, when I was almost 11, I took a long walk one day with my old friend, the girl E. We entered a patch of woods and ate our lunch, but no sense of sexual drawing toward the girl came over me and she did not offer to entice me. I slept with her boy-cousin one night, and her neuropathic aunt, a retired lady physician, bothered us by repeatedly creeping into our room. I felt intuitively that she was watching to see whether we would commit mutual masturbation--which we had no thought of doing. Three years before I had opened the door of her bedroom suddenly and saw E.'s naked form. The physician had been examining her, E. told me later. My guardian also annoyed me by repeated warnings not to play with myself.

Just before I turned 11 I was sent to a small and so-called "home" boarding-school. Eight of us lived in the smaller dormitory. The matron roomed downstairs. There was no resident master--a serious error. We small boys were told to strip one

evening. We were then tied neck-to-neck and made to dance a

"slave-dance," which was marked by no sexuality. A boy of 15, R.,

one afternoon gave me the astonishing information that my father

had taken a part in my procreation. Up to this moment I had known

only of the maternal offices, information of which had been

beautifully supplied to me by my guardian when I was 7 years old.

At that time I talked freely about the coming of a baby brother

in a distant city; I watched the construction of baby clothes; I

named the newcomer, and I was momentarily disappointed when he

proved to be a girl. This same R., a strong boy with a large

penis, got into the custom of lying in bed with me just before

lights were put out. He would read to himself and occasionally

pause to pump his penis and make with his lips the sound of a

laboring locomotive. I felt impelled to handle his organ, for I

was fascinated by its size, and stiffness, and warmth. Rarely he

would titillate my then small and unerect penis. R. never

ejaculated when he was with me; hence not until my third year was

I acquainted with the appearance of a flow of semen. Sometimes R.

would stop during his dressing to manipulate his penis, but was

such a picture of rosy health that I doubt whether he brought

himself often to ejaculation. R. told me that he had been to a

brothel where his genitals were examined to determine whether

they were large enough and not diseased. He also

related how he

"played cow" with a girl of his own age, she consenting to perform _fellatio_ upon him. A dark-skinned, unwashed, pimped but fairly vigorous boy of 16, with an irritable domineering manner, told me the delights of coitus with a girl in a bath-house, and I overheard his conversation with another "old" boy concerning the purchase of a girl in a big city for the sum of five dollars. No details were given.

I will now pass to my third year, when I was 13 years old. A large, well-set-up boy of 16, A., became my idol. His toleration of my presence in his room filled me with endless love. When I lied about a matter in which he was concerned, his denunciation of me brought me to a state of shuddering and weeping unspeakable. When our relations were established again A. allowed me to creep into his bed after the lights were out, and there I passionately embraced him, but without performing any definite act. When I turned over on my side with my back to him he drew my prepuce back and forth until I experienced orgasm, but not ejaculation. I would return his favor by pumping his erect penis, but with no ejaculation on his part. He did not propose _fellatio_, and I did not think of it. One night when he was in my bed I began to masturbate very slightly, whereupon he laughed, saying: "So that is the way you amuse yourself!" As a matter of

fact the habit was not fastened upon me. He always laughed when the rubbing of his finger on my exposed glans caused me to shrink. Another boy, H., now began to show me his erect penis and we practiced mutual manipulations. A. laughingly told me how he had caught H. in the act of masturbating as he stood in the bath-tub. A. told me a number of sexual stories--how he enjoyed coitus in the bushes with a girl on the way home from entertainments; how half a dozen boys and girls stripped in the basement of a church and performed coitus on the velvet chairs which stood behind the pulpit; and how he and a younger boy, who camped out together, played with each other's genitals. F., a boy of 11, was highly nervous, subject to timidity and tears on the slightest provocation, often morose, and under treatment for kidney trouble. His penis was erect whenever I saw him undress. He told me that a partially idiotic man taught F. and his companion how to masturbate. The man invited the boys to his tent and there pumped his organ until "some white stuff came out of it." F. also told me that an Indian princess in his part of the country would permit coitus for fifty cents. A. sometimes slept with F., and I could imagine their embraces. S., a secretive, handsome boy of 13, wetted his bed with urine every night. The only sign that he gave of an interest in sexuality was his laughing remark concerning the coupling of rose-

bugs. Of his

chum, my beloved C., I will speak later. My small room-mate

handled himself only slightly. I never had a desire to lie with

him, since I disliked him, nor with my first room-mate, a

"chunky," fiery boy of 10, whose penis interested me merely

because it was circumcised and almost always erect.

His

masturbation was also so slight as not to attract any particular

attention. A lusty German boy, B., showed no signs of sexuality

until his third year, when he laughed about his newly-appearing

pubic hair, and told several of us openly of how he enjoyed to

play "a drum-beat" on his penis before going to sleep. "I don't

do it too much, though," he explained. He showed a mild curiosity

when I gave him the resumé of a book on cohabitation which

contained illustrations of the erect penis and the female organs.

I had found this book in the woods and I read it eagerly during

my third year.

I came to the point of agreeing with A., who said: "Everyone is

smutty." Indeed I lived in a lustful world, and yet my mind was

bent also on books, and writing, and the outdoor world. I was

overgrown and splendidly developed, with a medium-sized penis and

a scant growth of pubic hair. My face wore a somewhat infantile

expression. My mouth was a perfect "Cupid's bow," my hair thin

and light. I was troubled about my snub-nose, which gave the boys

a great deal of amusement. As a matter of fact I exaggerated its upward tendency out of my morbid self-consciousness and cowardice. My imagination was extraordinarily intense, as it had always been. I was sensitive to smells and sounds and colors and personalities, and to the subtle influence of the night. I was timid and easily moved to tears, but not from any physical weakness until after. At the lower house there was the boy Z., famed for his large penis; and the older G., a boy of 15, who was the leader in sexuality at his dormitory. Z. showed me his penis and exposed his glans often enough, but we did not manipulate each other. G. told us to notice how large a space his penis occupied in his trousers, and laughed over Z.'s custom of masturbating by means of a narrow vase. G.'s special lover was a nervous boy of ten. It is remarkable that none of us mentioned _fellatio_ or _pædicatio_. These acts may have occurred at school, but not to my knowledge. We did not have much to say sexually about the girls. We heard rumors of a 16-year-old, V., who had been sent away from school for coitus; and my first room-mate was said to have obtained _conjunctio_ with a girl under cover of the chapel shed. Once A. and I pointed a telescope at the open windows of the girls' dormitory, but we saw nothing to interest us. A day-scholar, J., a pale, nervous, bright boy of 13, took me into the study of his uncle-physician

and together we
gloated over pictures of the sexual organs. A. was
with us on one
occasion. J. told me how he liked to roll over and
over in bed
with his hand placed under his scrotum. This act, he
said, made
him imagine that he was obtaining coitus. He advised
me to slide
my penis back and forth in the vagina whenever I
should actually
obtain coitus. In my room at school J. once drew an
imaginary map
of a bagnio, in which the water-closet was carefully
displayed
en suite with the bedrooms. J. and I never
masturbated
together. Indeed, I cannot remember seeing his
organ. A hulking
boy of 16, who lived opposite the school-grounds,
became intimate
with J., and we three went on a walk up the railroad
track. The
big boy, W., tried to inflame my passions by telling
me how he
and J. had had coitus with a handsome black-haired
widow in town,
but I remained cold.

During this year I fell in love with C., a popular,
talkative,
witty boy of my own age, or perhaps a year younger.
He fancied me
and we slept together one night under the most
innocent
circumstances. I never dreamed of having sexual
relations with
him, and yet I fairly burned with love for him. My
stay at his
beautiful home over Sunday while his parents were
away was one
long delight. We slept in each other's arms, but
there was no
sexuality. En route to C.'s home he pointed with a
glove to a

little working-girl, saying he would like to have intercourse with her, but this was the only remark of the kind that ever passed his lips in my presence. When undressed save for his undershirt, he laughingly held his unerect organ in his hand and made the motions of obtaining conjunction with an imaginary partner. Once we spoke of masturbation (I could recite the information of my good physician with a marvelous show of virtue), and C. remarked: "Yes, doing that makes boys crazy." C. finally grew tired of my deceptive, babyish nature and ultra-interest in books and puzzles, but I cherished an undiminished affection for him, and when he was detained at home for a fortnight with a broken arm, I wrote him a passionate letter, which I sobbed over and actually wetted with my tears. But the fervor of my passion died at the close of the year. I consider this unsullied friendship to be the only redeeming feature of my sensual days at school.

Versed as I was in the warnings against masturbation, I found pleasure one afternoon when I was alone in slipping my penis through the open handle of a pair of scissors and in violently flapping my partially erect organ until a strange, sweet thrill crept over me from top to toe and a drop of clear liquid oozed from my member. But I gave up the manipulation with scissors, finding a greater satisfaction in masturbating while

I was

defecating or just after it. I either pumped my organ by slipping the prepuce back and forth, or I grasped the organ at its root and violently jerked it back and forth. I soon began to masturbate not only every time that I defecated, but also at night just before I went to sleep, and sometimes early in the morning. On the whole I preferred the jerking just described. I always brought about ejaculation after perhaps five minutes of violent exertion.

My penis became chafed at the root, but I did not especially care. I remember the afternoon that I masturbated for the first time while I was defecating in the school water-closet. I cannot recall that at first I thought of coitus while I masturbated. On one occasion I masturbated over the vase de nuit after a delightful afternoon of tobogganing exploration up and down the mountain.

During this first year of abuse, I felt no ill effects whatsoever, although I realized, in an unthinking way, that I was doing wrong. But sexuality had assumed the proportion of a regular feature of our school life. It was difficult for me to place a "universal" view in its true perspective. I used to smile at the glazed, dull morning eye of poor H., who was a stunted boy of 15, and thus could not endure his losses so well as I could

endure them. The qualms of conscience which I suffered were lost in my delight in my dawning sexual life. Sometimes I lay on my stomach in bed, and by placing my hand under my scrotum, according to the directions of J., brought up a pretty girl to mind. Just before Sunday school G., our chief reprobate, and the rest of us would hunt out what we considered to be nasty texts of Scripture. The chapter concerning the whoredoms of Aholah and Aholibah gave me an especial pleasure. T. mentioned the giggling that occurred at prayers in the lower dormitory when the details of Esau's birth were read out. A few days before G. was expelled--for exactly what cause I do not know--he told me of how greatly he enjoyed coitus on his grandmother's sofa with a girl of fifteen. When I went home on the boat for holidays I noted the large, black-haired penis of the strong boy of our school. He occupied a state-room with me, but made no sexual overtures.

Since my twelfth year I had been wrapped up all summer long in a boy who was six months my senior. We slept together constantly, but not once did we think of obtaining mutual gratification. On the contrary, we held up high ideals to each other and frowned on masturbation. I took delight in saying that I never had handled myself, and never would do so. Even at the height of my "auto-erotic" period, I skillfully concealed my habits from all

my boy friends. A neurotic solo choir boy friend once spoke of obtaining ejaculation, whereupon I expressed utter ignorance of such an act, little hypocrite that I was. This boy told how the house servants joked with him about coitus and made laughing lunges at his organs.

But much as I loved my chum, my most passionate regard went out in my thirteenth year to N., a chubby, blue-eyed, choir-boy of 12. He was a pretty boy to any eye. He was not gifted, except in water-sports, and anything but popular either with girls or with boys; yet I grew warm at the mention of his name. He did not care a fig for me. From first to last I had no consciousness of the sexual nature of my passion, and the thought of doing more than embrace and kiss him in an innocent manner never crossed my mind. For two summers I had nights of tossing on my bed (although I almost never was sleepless for any cause) when I would see his dear face and form, in and out of the swimming pool, or engaged perhaps in singing or in showing his beautiful teeth. I seldom was smitten with little girls, and I found myself embarrassed in their company after my ninth year; yet I thought well enough of their looks and ways to enjoy their company at dances. The girls liked me in a platonic way, for I was accounted a good, big, kind, blundering boy with a helping hand for the smallest fry.

During the summer after I was 13, I imagined myself in the early morning, when I was half awake, as persuading my wife to have coitus with me. In the course of my spoken words I kept my hand under my scrotum.

A plump girl-cousin of my own age was visiting at my uncle's during the summer after I was 13. With her I greatly desired to satisfy myself, but I could not be sure that my boy cousin (5 years old) might not find us out, even though she should consent.

Once when we three were in the hay-loft a wave of lust rolled over me, but I made no proposal. Night and gaslight greatly increased my libido. On one occasion my aunt had gone to the village for ice-cream, and L. and I were left alone in the dining-room. I took her on my lap and had a powerful erection. I almost asked her to play sexually with me in the barn, but instead I spoke of an imaginary girl, the first letters of whose successive names spelled an indecent word for coitus--a word known to almost every Anglo-Saxon child, I fear. L. laughed, but gave no sign of assent. For a neighboring girl of 15 I felt such a drawing that early in the morning I would roll on the floor with my erect organ in my hand in riotous imagining of coitus with her. I walked with her in the woods and sat at her feet, but although I felt instinctively that she would satisfy me without much persuasion, yet I could not ask her. One

night I started
to church in order to walk home with her, and lead
her (if
possible) to a field where we might gratify
ourselves (I picked
out the exact grassy spot where we might lie); but
when I was
almost at the church door my "moral sense" (if that
is what it
was) rose and dragged me home again.

During the swimming hour I watched the genitals of
the boys,
comparing them carefully in the most minute details.
Circumcised
organs affected me as being disagreeable, and men's
hairy, coarse
genitals I abhorred.

When 13 I became acquainted with the new mail-boy at
the inn. He
was a city "street-boy," and got me into smoking
cigarettes
occasionally. I did not definitely take up smoking
until I was
16. He told me that a mason once offered him ten
cents if he
would masturbate the man in a cellar. The boy said
that he
refused. I slept a few times with an ill-favored boy
of fine
parentage. He was of my own age, and I had played
with him in a
natural way for several years, but my increasing
sexual desires
led me to mutually masturbate with him, and even
unsuccessfully
to attempt with him mutual pædicatio. On the morning
after our
nights of sensuality I felt "gone" and miserable,
but not
repentant. By afternoon I was myself again. My
relations with G.
were purely animal, for I disliked his jealous
disposition, his

horse-laugh, his features, his form, his withdrawn scrotum and his undersized penis. At home in the evening I often found myself inflamed with a mental picture of active _fellatio_ with him, but I never performed this act, so far as I remember.

One of my great sexual desires was to walk along a fence on which a girl was seated. In order that I might feast my eyes on her pudenda she must not wear drawers.

When I turned 14 I had been, from my unusual size, in long trousers for several months. I entered a private day-school and progressed brilliantly in my studies. I kept up masturbation almost daily, sometimes twice a day, both in the water closet and in bed. I can remember ejaculating before urination in the school _cabinet_. At night I often found myself longing for the return of my sister, seven years my junior, in order that I might embrace her in bed and fondle her genitals. I had done these things during my Christmas vacation of the year before. I mildly reproached myself for such incestuous desires, but they recurred continually. I dreamed little. And I cannot remember the character of my dreams. My waking _libido_ spent itself mostly in longings to embrace (without lustful acts) the forms of little boys of exquisite blonde beauty and thick hair. Narcissism may have been present, for in my twelfth year I had been told that at the age of 5 and 6 I was an extraordinarily

beautiful little
creature with long, lint-white hair. The preferable
age was from
6 to 9. My eye was alert on the streets for boys
answering to
this description, and a street boy with long, white
hair so won
my passion that I followed him to his home and asked
his mother
if he might call on me and "play some games." As I
did not even
know the boy's name and had never seen him before, I
was
wonderingly refused. I sought in vain to find the
whereabouts of
another long-haired street boy whom I burned to
embrace and load
with benefits. I had a boundless desire for such a
boy as this to
idolize me--to look into my face out of big eyes and
lose himself
in love for me--to call me by endearing pet names--
of his own
accord to throw his arms around my neck. This second
actual boy
disappeared from my horizon by presumably moving
away from the
vast city neighborhood. I took a fancy to a small
boy at school,
who possessed the requisite delicacy, timidity, and
sweetness, if
not the physical requisites, of my beau ideal. I
walked with him
in the park and planned to have him at the house;
but the matter
was not arranged. At boarding-school I had
associated much with
younger and weaker boys, and had been ridiculed much
for my
cowardice in sports, but at the city school I moved
with my
equals and won their recognition. Our gymnasium
director was
middle-aged and of an indolent disposition. He liked
to recall

his youthful erections and to answer my sexual queries too fully, and cheerfully volunteered information on brothels. Yet I doubt whether he had an evil purpose in conversing with me. I thought I should never dare or want to enter one. I always conjured up the picture of a row of naked women from whom I could take my pick, and the smell of the women I imagined to be identical with the smell of my big friend A. at boarding-school. When I was traveling down town on an elevated train one afternoon the brakeman asked me whether I had ever been in a brothel, and told me that disorderly houses abounded in my neighborhood. "I have had connection with women," said this red-haired young man, waving his hand in greeting to a woman who nodded at him from a window, "since I was 15 years old. Not long ago a fine-looking, young woman in black offered to pay all my expenses if I would live with her and connect with her."

When a girl of perhaps 7, a distant cousin of mine, visited us for a few days, I gratified my lust by placing my hand under her genitals and swinging her to and fro. She giggled with pleasure. That summer I began to experience the evil effects of the masturbation which I had practiced daily for a year and a half. Pimples began to break out on my chin (my complexion up to this time had been white and delicate). The family ascribed my condition to digestive difficulties. In playing with

the boys and
girls I found myself seized with a terrible shyness
and a
tendency to look down and weep. I had lost all the
courage I
had--it had never been great--in the presence of a
crowd of
children. I was fairly at ease with a single
companion. My
self-consciousness was something more painful to me
than I can
convey in words. At home I wept in my room and
cursed myself for
a baby. I little realized the cause of my nervous
collapse. Yet I
had too robust a frame not to be able to sleep and
to play hard.
The sympathetic pleasure which I had found in
swinging my
girl-cousin to and fro I now doubled by letting a 7-
year-old boy
ride cock-horse on my feet. I experienced an
erection during the
process, and I almost induced ejaculation when I
tickled the boy
with my feet in the region of his genitals. To see
his shrinking,
giggling joy gave me an exquisite sexual thrill. I
longed to
sleep with the boy, but I was afraid of causing
comment. At the
new and large boarding school which I entered in the
fall my most
lustful dreams and ejaculations were concerned with
standing this
little boy on the footboard of a bed, taking down
his
knickerbockers, and performing _fellatio_ on him.
But I dreamed
also of natural coitus. I fell in love with the
handsome,
12-year-old son of the aged headmaster. The boy, O.,
sat next me
at the table, and I never tired of gazing at him. It
gave me a

special sense of pleasure to look at him when he wore a certain flowing, scarlet, four-in-hand necktie. But O. was not attracted to me--for one thing I was in a disagreeably pimpled condition--and I could not induce him to linger in my room nor to sleep with me. My passion for O. did not diminish, and it rose to its supremacy on the evening when he appeared in our hallway (he roomed on the girls' side of the house and hinted at the sexual sights that he saw) in a costume of white satin, lace, and wings. He was ready for a costume party.

I now masturbated less frequently, for I was beginning to appreciate the horrible consequences of my indulgence. I had frequent pollutions, with dreams. My day was one long agony of fear. How I dreaded to go to sleep in the same bed with my older chum, who never made any advances beyond embracing me passively _cum erectione_ while he was asleep. My day was one long agony of fear. At meal time my feet constantly writhed in agony for fear that the headmaster's grown up young ladies should make fun of me, or that my lack of facial composure and my inability to look people in the eye might be commented upon. I tingled with apprehension, especially in the region of my stomach. Every nerve was taut in the effort I made to appear composed. I masturbated with erections over nothing. Greek recitations were for me an _auto da fe_. My heart beat like a trip-hammer at the thought of

getting up to recite, and once on my feet my voice
shook and my
mind wandered. I hated the thought of people behind
me looking at
me. I rarely summoned the courage to turn my head
either one way
or the other. I vastly admired the "bravery" of the
small,
15-year-old boy who recited so calmly and so well. I
was too
cowardly to play foot-ball and base-ball, and I
dreaded even my
favorite tennis because the spectators put me in a
state of
scared self-consciousness. Knowing my own condition,
I was yet so
blind to it most of the time, and such a Jekyll-and-
Hyde, that I
actually pitied a boy of 19 who was an eccentric and
a scared
victim of masturbation. But in spite of my
neuropathic condition
I developed intellectually. I do not touch upon this
aspect of my
life, however, because I am trying to limit myself
strictly to
sexual manifestations. At the present time I have
not the courage
to continue the narrative.

HISTORY III.--The following narrative is written by
a clergyman,
age 40, unmarried:--

My childhood and early boyhood were unmarked by
sexual phenomena,
beyond occasional erections, which commenced when
about 5 years
of age, without any exciting causes. These were
accompanied by
some degree of excitement, of the same nature as
that which I
experienced in later years. I was absolutely
ignorant of sexual

matters, but always had an idea that the essential difference between man and woman was to be found in the genital organs. This was sometimes a matter for thought and curiosity.

Being for many years an only child I saw little of other children, and formed the habit of amusing myself with making things--boats, houses, etc.--and acquired a taste for science. When I could read I preferred biography, history, and poetry to anything else.

When I was 13 years old and at a large school I heard for the first time of coitus, but very imperfectly. For a few days it filled my thoughts and mind, but feeling it was too engrossing a subject and one which took me off better things, I put it out of my mind. Later, another boy gave me a fuller description of the matter, and I began to have a great desire to know more and to be old enough to practice it. I also discovered that boys masturbated, and about a year after tried the experiment for myself. This vice was largely indulged in by my school-fellows. It never occurred to me that it was sinful, until I was nearly 16, when I came across a passage in Kenns's Manual of Schoolboys, in which it was hinted such things were wrong morally and spiritually. Previously I had felt it was an indelicate and shameful thing, and bad for health. This last idea was held as a solemn fact by all my boy friends.

Gradually

religion began to exert an influence over my sexual nature,

obtaining as years passed a greater and greater restraining

power. It is simply impossible for me to write a history of my

sexual development without also describing the action which

Christianity has had in determining its growth. The two have been

so intimately bound together that my life history would not be a

faithful record of facts if I left religion out of it.

At school I took part, with great keenness, in cricket and

foot-ball, and was very ambitious to excel in everything in which

I took an interest, but I always had other tastes as well, which

were more precious to me, for example, the love for science,

history, and poetry. Until I was past 16 years my desire was

simply for coitus, girls and women attracted me only as affording

the means of gratifying this desire; but when I was nearly 17 I

began to regard girls as beautiful objects, apart from this, and

to desire their love and companionship. At the same time it

dawned upon me that life held much of joy in the love of women

and in domestic life--so henceforth I regarded them in a higher

and purer light, and apart from sexual gratification. In fact,

from this period till I was over 20, this idea so dominated my

whole being that the lower side of my nature was entirely held in

subjection and abeyance by it. It was rather

repulsive to think
of girls as objects of lust. This state of mind was
not brought
about by any romantic attachment or through any
acquaintance or
through circumstances. I was living in great
seclusion and had no
girl friends. After this period the lower side of my
nature woke
up as a giant refreshed with wine, and I underwent
for many years
a constant struggle with my nature, in which
religion always
triumphed in the end. I never fell into fornication,
though
sometimes into the vice of masturbation. These
outbursts of
desire were periodic, about ten or fourteen days
apart, and would
last several days. I must record also the fact that
from the time
this awakening took place my ideal views of woman no
longer
seemed incompatible with sexual relations. I noticed
that at
about 27 there was a lessening of the desire, but
that may have
been due to overwork and consequent nervous
exhaustion. I had a
good deal of worry and studied daily for about eight
hours. In
any case the impulse was strongest during the years
above
mentioned. A little later in life, for a time, I
became attached
to a girl, and eventually engaged. I then observed,
greatly to my
sorrow and annoyance, that whenever I met this lady,
or even
thought of her, erections took place. This was
particularly
painful to me, as my thoughts were not of a lustful
or impure
character. Sometimes sitting by her at a religious
service this

would occur, when certainly my mind was far away from anything of the kind. That was the first woman ever kissed by me, except of course members of my immediate family circle. Later on my thoughts turned to marriage, and there was a great longing at times for this event to take place. However, as this attachment afterward became the great sorrow of my life for years, it needs no more comment. This closes one chapter of my history, and at present I do not propose to add another, as in a great measure it is only partly written. It may be well here to state that there has never been in me the slightest homosexual desire; in fact it has always appeared as a thing utterly inconceivable and disgustingly loathsome. I am fond of the society of both men and women, but on the whole prefer the latter. I have had several warm and intimate though platonic friendships, and get on exceedingly well with the other sex, although not a good-looking man. I have always been attracted to women by their spiritual or mental qualities, rather than by physical beauty, and feel strongly that the latter alone would never cause me to desire coitus. Unless there was an attraction other than that of the flesh, I should feel that I was following simply a brute instinct, and it would jar with my higher nature and cause revulsion. This was not the case in my earlier years to the same extent. I have often wondered whether the sexual

impulse was
strong in me or not, but if not, there is nothing in
my physical
state or family history to account for it. I am
fairly cognizant
with the lives of my ancestors, being descended from
two old
families. The sexual instinct was certainly not weak
or abnormal
in them. Personally, I am tall and healthy, well
built, but
sensitive and highly strung. Smell has never played
any part in
my life as a stimulant of sexual desire, and the
mere thought of
body odors would have a very decided effect in the
opposite
direction. Touch and sight appeal to me strongly,
and of the two
the former most.

I am convinced, after many years careful thought,
that sexual
vice and perversion could be greatly reduced if the
young were
instructed in the elements of physiology as they
bear on this
question. Personally, had I been thus enlightened
much sin would
have been avoided in my schoolboy days, and a
perverted view of
sexual matters would never have arisen in my mind.
It took years
to overcome the feeling that all such things were
unclean and
defiling. Eventually light came to me through
reading a passage
in a tractate on the Creed by Rufinus. He was
defending the
doctrine, of the Incarnation against the pagan
objection that it
was an unclean and disgusting idea that God should
enter the
world through the womb of the Blessed Virgin Mary,
and he meets

it by showing that God created the sexual organs,
therefore the
objection is invalid--otherwise God would not be
clean or pure,
having Himself designed them and their functions.
This passage is
slight in itself, but gave birth to a line of
thought which has
influenced me profoundly. I no longer regard sexual
matters as
disgusting and unholy, but as intensely sacred,
being the outcome
of the Divine Mind. Further, the Incarnation of the
Saviour has
not only sanctioned motherhood and all that is
implied by it, but
has eternally sanctified it as the means chosen for
the
manifestation of God to the world. I should not
obtrude my
theological conceptions, but for the fact that they
have
determined my life-history in that aspect.

HISTORY IV.--When I was 9 years old a boy at the
preparatory
school, which I attended, showed me the act of
masturbation,
which he said he had practiced for a long time, and
which he
urged me to imitate, if I wished to become a father
when I grew
up, and married! Boy-like I believed him and tried,
but the
sensation obtained was not a pleasant one (I suppose
that I was
too rough with myself) and I desisted.

When I was about 12 years old, a schoolfellow told
me that he had
seen his nurse copulating with the groom, and he and
I used to
haunt the woods in the hope that we might see an
amorous couple

so engaged, but without success. We often talked of the act, as to how it was done. Neither he nor I had any clear ideas on the subject, save as to the organs involved. I was about 15 when a maidservant of the house in which I was a boarder, came to my bedroom one night and taught me how to masturbate her. She said that this was a good thing for me to do, and warned me never to "play with myself" as it would kill me, or drive me mad. I told her that I had tried it, but could not bring on a pleasurable feeling, so she did it to me, and although I did not have an emission, I derived great pleasure from the act. She told me that it never did a boy any harm to let a girl play with his parts, and promised that if I would keep the secret, she would often do this for me. Naturally I promised to say nothing, and she often came up to my room. Later on she used to insert my penis into her vulva, while she was rubbing it, at the same time giving me a pigeon kiss. This modus operandi was much appreciated by me.

One night, after we had been together thus, I dreamt of her and her maneuvers and had my first emission. I was very proud of this, as I considered that I had at last attained to man's estate, and told her of it. She never allowed me to insert my penis into her vulva after that, alleging that she did not want to have a baby.

I was about 16½ years old when I had my first real

coitus, my
partner in the act being a girl some two years older
than I, who
lived near us. I enjoyed the act very much, as she
permitted, nay
insisted on, emission _intra vaginam_, and told her
that this was
much nicer than my amours with the maidservant which
of course I
had confided to her. She laughed, and said: "Of
course." We often
copulated, as long as I was at home, and then I lost
sight of
her. Of all the women with whom I have had to do,
save one, she
had the most copious secretion of mucus, which in
those days I
believed was the woman's semen. Her thighs used to
be wet with
it.

At the University I had regular relations with women
of all
sorts, rarely missing a week. Two of them were
married women, one
the wife of a solicitor, the other of a doctor. How
proud I felt
of my first intrigue with a married woman! I felt
that I was
really a man of the world now!

But though my friends used to tell me all about
their love
affairs, and I longed to confide in them, I did not
do so. This
was because when I went up to the University, my
uncle said that
he would give me a word of advice and hoped that I
would follow
it--never to give away a woman, and never to refuse
to respond to
a woman's advances, whoever she were. To neglect
this advice
would, he said, be foolish, and to break the rules
"damned

ungentlemanly." I wish I had always followed advice proffered, as closely as I have followed this. One night, when I was somewhat disguised in liquor, as our grandfathers would have put it, I picked up a girl, who was a private prostitute, if the phrase be permissible. She declined copulation, and proposed other means of satisfaction. I insisted, being stubborn in my cups. Had I been sober I should have done as she suggested, for I have always made it a point to allow the woman to choose the method of gratification, and not to demand, or even suggest, anything myself. I like to please women, and I have always been curious as to their wants and desires, as revealed, without outside influence, by themselves. The result of my refusing all methods of gratification save the most ordinary was that the girl, who must have known that she was not all right, but shrank from saying so in so many words, gave me a gonorrhoea, which lasted nine weeks and much interfered with my amours, as I naturally declined to run the risk of infecting my partner, a risk which to my certain knowledge many a young fellow has run, with disastrous consequence to the confiding woman. As it was due to my tipsy obstinacy, I could not blame the girl, but resolved never to drink too much again, a resolve which I have kept, save once, unbroken. In those days we youngsters thought that it was manly to be able to carry one's liquor well, and did all

in our power
to attain to the seasoned head; but I considered
that the risks
entailed were too serious to be neglected.

I was well on in my 26th year when I met a widow
with whom I fell
in love, with the result that I married her. She is
a most
sensible woman, and it was her intellectual gifts
which were the
attraction to me. In my amours intellect has never
played a part.
She has all along been cognizant of, and lenient to,
my
polygamous tendencies; for she recognizes the fact
that whatever
fredaine I may have on hand makes not the
slightest difference
in my love and respect for her. Were she a more
sensual woman,
perhaps things would be different.

In all I have had to do with 81 other women, of
whose special
characteristics I kept a careful note at the time.
Twenty-six
were normal women with whom my _liasons_ have lasted
long, so I
know more about them than I do about the other
fifty-five, who
were prostitutes, and with some of whom my dealings
were but for
an afternoon.

The races represented have been these, for I have
seen a bit of
the world: English, Scotch, Irish, Welsh, French,
German,
Italian, Greek, Danish, Hungarian, Roumanian,
Indian, and
Japanese. Taking them all round, the only difference
that I found
between old and young women is that the older ones
are less

selfish, and more complaisant, and less inclined to
resent one's
being unable to attain to the height of their
desire, for from
time to time I have been unable to "come up to the
scratch" after
a heavy night's labor, or when I was afraid of being
caught in
the act of coition, a fear which, in my experience,
acts as a
stimulus to desire in women, unlike its action in
men. Of all the
women with whom I have had to do the nicest in every
way have
been the French women. The English women of the town
drink too
much, and are far too keen on getting as much money
as they can
for as little as they can, to please me. Were the
London girls to
recognize that men do not like a tipsy woman, and
that where
there is so much competition the person who is most
skillful and
most polite gets the most custom, the alien invasion
in Regent
street would soon come to an end.

Of the fifty-five prostitutes: eighteen informed me
that they
were in the habit of masturbating; eight of their
own free will,
without asking for reward, did _fellatio_; six asked
me to do
cunnilingus, which I naturally declined to do;
three proposed
anal coitus. Of those who did _fellatio_, two (one
French and one
German) told me that they had taken to it because
they had heard
that human semen was an excellent remedy against
consumption,
which disease had carried off some of their
relatives, and that
they had gradually come to like doing it. All who

told me that

they masturbated, asked me whether I did so too, and two desired

me to show them the act, one alleging that she liked to see a man

do it; she had been married late in life, after a "stormy youth"

and had had, she said, a large experience of the male sex. They

all seemed to think that however much the practice of

self-excitement might hurt a man, and all thought that it would

hurt him, a woman might masturbate as often as she liked, failing

better means of satisfaction, as she had no such loss of

substance as a man.

Of the twenty-six normal women, whom I knew more intimately than

I did the fifty-five prostitutes, thirteen, without being

questioned by me, blurted out the fact that they were habitual

masturbators, apparently all required to think of the loved

person to obtain full satisfaction. Fellatio was proposed, and

fully performed, by nine, of whom three experienced the orgasm as

soon as they perceived that I had attained to it. All were more

or less excited while doing it. One proposed anal coitus, "just

to see what it was like;" and three proposed cunnilingus, one

having been initiated by a girl friend, and one by her husband.

The third had, I believe, evolved the act out of her own inner

consciousness in her desire to experience pleasure with me. My

relations with one of the twenty-six were confined to my

masturbation of her, the while she did _fellatio_,
as she said
that she "had no feeling inside down there."

With two exceptions my partings from these normal
women have not
been tragic and all whom I have met in after life
(seven) have
been very ready to resume relations with me, four of
them having
made the proposal themselves.

One thing has struck me, and that is the, often
great, difference
that exists between what a woman's looks lead one to
think she
is, and what she is when one becomes her lover; the
most sensual
woman that I have met might have sat for her
portrait as the
Madonna, and she was the only one who took pleasure
in hearing
and relating "smoking-room stories," a form of
amusement which,
perhaps from their want of appreciation of humor and
wit, women
do not indulge in--at least in my experience.

HISTORY V.--(A continuation of History III in
Appendix B to the
previous volume.)

As I became better I commenced to dream of true
love. I wondered,
too, if my horrible past really could be lived down
and a young
woman come to love _me_. I took pleasure in reading
love poems,
especially Browning's, and illustrated some with
little
water-colors....

I was sitting in the stalls one night seeing a
performance by a

company of English actors when one of them played so badly that I

thought to myself: "Why, hang it, I could play it better myself!"

The next minute another thought followed: "Why not try?" I came

out of the stalls the proverbial stage-struck youth. I was

sitting in the same place another night when the young man next

to me entered into conversation. By a strange coincidence he knew

a few young men, amateurs, who were going to form a company, give

up their situations and travel, if they could induce a few more

to join them and put a little money in. I made an appointment for

the following evening....

There were lots of meetings in bedrooms and rehearsals between

the beds, but ultimately I was told a school-room had been

engaged and a professional actress, A.F. I went to the

school-room and found all the boys there, and a young woman with

a pale, rice-powder complexion. On introduction she gazed at me

as if struck dumb. If she had been better-looking (I thought her

vulgar and puffy) I would have been flattered. I was disappointed, but rather frightened (she had a stage presence) of

her professional ability, especially when we commenced to

rehearse. I had to make love to her, too, which embarrassed me.

She had a good profile, I noticed, and would have been better

looking, I thought, if she were in better condition, for she was

young, about my own age, twenty-three or four. We were all

young--enjoyed our rehearsals, and had lots of fun--
but I did not
respond to the advances A. was evidently making to
me. Finally we
started on our tour. As the weeks went on A.F., like
the others,
improved wonderfully in health and appearance. If we
had had
anything like houses it would have been a pleasant
trip. My
strangeness did not escape the notice of the boys
altogether, for
I was still a bit strange in mind and nerves--and
deeply
religious, bowing my head before each meal and
reading my little
Bible and prayer-book at odd times. I drank no
alcohol. I spent a
good deal of time by myself or with my faithful
companion A., who
was nearly always at my side, she and her appealing
eyes. I was
surprised to see how quickly she had improved; she
looked quite
attractive and ladylike some evenings at meals, but
I only
tolerated her. I was selfish and conceited.

Things had been going on like this for a week--
always playing to
empty houses and our money lower and lower--when A.
said to our
other lady, Mrs. T., on a train in my presence: "I
shall have to
give him up, I suppose; he will have nothing to do
with me." Mrs.
T. said: "You give him up, do you?" and looked at me
as if she
were going to try her hand. A. said "Yes," and
looked at me,
smiling sadly. I don't know what motive prompted me--
whether my
vanity was alarmed at her threatened desertion or
that she had
really made some impression on me by her love,

probably a little
of both--but I said: "No, don't; come and sit down
here," making
way for her, and she joyfully came and nestled
against me. From
that time I ceased to treat her with ridicule, and
kissed her at
other times than when on the stage. I was subject
still to black
moods, and would not speak to her for hours
sometimes, but she
seemed content to walk with me and was infinitely
patient. I had
heard she was living with--if not married to--an
actor. I asked
her about him once, and she said she did not love
him; she loved
me and had never loved before. Her face had a
touching sadness;
her life had been unhappy and stormy, with no love
and little
rest in it. Her face, when she had lost her
dissipated look and
unhealthy pallor, was exquisite, delicate as a
cameo. Love had
improved her manners, too; she was more gentle and
refined. I let
things drift without thinking of the future, when
one night
after the performance--I was lying on the sofa and
A. was sitting
at my side, as usual--I suddenly thought, with the
brutality that
characterized me in these matters--"I will ask her
to let me
sleep with her." I still fought against any
premonitory thought
of self-abuse, but here, I thought to myself, is a
chance of
something better that will do me no harm and perhaps
good. When
she understood me she turned very red and walked
away, shaking
her head. But I let her understand that was the only
way of

retaining me, and finally, when they had all gone to bed, she gave herself to me, reluctantly and sadly; for she, too, had been drifting on without thinking of anything of this sort (she hated it at this time), but just living for her love of me, her first true love.

Before this occurred, I must tell you, I had been so much better that I sometimes felt capable of doing anything, a sense of power and grasp of intellect which was combined with delicacy of feeling and sensitiveness to beauty, to skies and clouds and flowers. I seemed to be awakening to true manhood, to my true self. And at meals, it is worth recording, I commenced to have a distaste for meat.

These glimpses of a better state of things left me on cohabiting with A., and for a time my gloom and black religious mania came on me once more. I now thought of my promise at confirmation, and it seemed to me I had offended beyond pardon. When we came to the next town, however, I openly slept with A. all night, leaving my own bed untouched. When we returned to Adelaide one of our party remarked: "The only man who had any success with the women on the tour was a Bible-reading, praying, and good, pious, confirmed Christian."

A.'s nascent beauty and delicacy and improvement were gradually impaired, too. My own conduct became so morose at

times that,
besides increasing her misery, I offended the
others, and
bickerings ensued. I heard the other actress say
"He's mad; that
what's the matter." And I was so wrapped up in
myself and my
religious mania that I did not mind their thinking
so.

After the tour was over A. asked me to come and see
her at her
home, and as I missed her very much I went one night
to tea. She
had a room in her father's house to herself. A. was
dressed in
her best and we had an affectionate meeting. After
tea I asked
her if she were married to E. She said "No." Then I
said: "Who
are you married to?" She commenced to cry then, and
told me
something of her life, the saddest I ever heard.
When only 17 she
had been courted by a young man she did not care
for, but who
prevailed on her parents by pretending he had
seduced her, but
wished to marry her. Strange as it may seem, A. did
not know what
marriage meant, her mother being one of those silly
women who
don't like talking of these things and let their
daughters grow
up in ignorance, expecting they will learn from some
one. In nine
cases out of ten this happens, but A. was an
exception. It was
this, and the fact that she had not a particle of
love for her
husband, that gave her such a hatred of coition.
When her mother
saw the sheets the morning after the marriage she
burst out
crying; she did not like the young man and saw she

had been
deceived.

A.'s husband soon showed his true character; he was in reality a gaol-bird. He beat her, drank, and even wanted her to go on the streets to earn money for him. She left him and went home; it was then she began her theatrical career by entering the ballet. At intervals her husband, drunk and desperate, would waylay and threaten her in the street. One day after a rehearsal he attempted to stab her. She got on in spite of all, being a born actress, and played small parts in traveling companies. Then E., who had also gone on the stage, courted her and she listened to him, not because she cared for him, but he protected her and offered her a home. She joined him; but his drunkenness and sensuality were so gross that he ruined his health and he attempted to maltreat A. in a nameless way. And whenever she was in the family way he would leave her alone and half-conscious in the cellar for days. To add to her misery she had epileptic fits. Then sometimes they would be out of an engagement and starving. They had been so hungry as to steal raw potatoes out of a sack and eat them thus, having no fire. She would often have had engagements, but E. was jealous and would not let her act without him. And he beat her as her husband had done, and her health became undermined. It was just after one of the forced

miscarriages that she joined our traveling company,
and that
accounted for her yellow and puffy appearance. E.
was now away
up-country with a circus, but was expected down any
time. A. told
me a good deal of all this, between her tears, while
sitting at
my feet, and her tone carried conviction. When I
ought to have
gone home I persuaded her to let me stay all night.
We had been
in bed some time when her mother knocked at the door
and wanted
to come in for something in a chest of drawers
there. "Why don't
you open the door, A.? Who have you got there?
Hasn't that fellow
gone?" A. was confused and told me to get under the
bed, but I
refused, and she covered me up with the bed clothes
as well as
she could and opened the door. She had hid my
clothes, but missed
one of my shoes, and her mother saw it. "Oh, A.,"
was all she
said; "you've got that fellow in bed," and went out
crying.
"Well, Fred" (my stage name), "you've got me into a
nice row," A.
said. She gave me my breakfast in the morning and I
walked out of
the front door without being molested. Another night
I entered
her window by a ladder and stayed all night. In the
middle of the
night E. came home drunk. She would not let him in
and told him
she would have nothing more to do with him. He
attempted to break
in the door, when A. called to me, and hearing a man
in the room
he went away, saying, as he went downstairs: "Oh,
A.! Oh, A.!"
as if he thought she would not have done such a

thing. He never
molested us after that night.

I think it was my intention, at first, to break off
with A.

gradually. I found, however, I could not keep away
from her, and

it commenced to be evident to me that a bachelor's
life in

lodgings again would be dreary and lonely. And all
this time the

fear that I had offended God troubled me more than I
have said,

and it occurred to me (there may have been a touch
of sophistry

in this, or not) that if I were a true husband to
her for the

future--stuck to her and worked for her for the rest
of my

days--perhaps it would find favor in God's sight and
be an

atonement for my sin. Had she been free I would have
married her,

I believe. But she began to be harassed by her
mother and

bothered about my incessantly coming there and
staying all night.

It ended in my telling her I would be a husband to
her, and she

came and lived with me at my lodgings. We had one
room and our

meals cost us sixpence each. Cheap as it was, it was
a struggle

for me to earn money at all. I remember feeling ill
and anxious

once, and sustaining myself by the thought of my
father wheeling

the heavy truck up the street when he married my
mother. And I

decided to wheel my truck, too.

A. seemed happy and her love increased, if possible;
at first,

though, she must have found me a trying lover, for I
made her

kneel and pray with me two or three times a day,
which she did
with such a queer expression of face. Sometimes her
feelings got
the better of her, and she would say: "Oh, damn it,
Fred, you are
always praying." And then I would be shocked and she
would be
sorry.... Coitus was frequent; she commenced to like
it now....

A. was not looking well one evening when she came
in, and lay
down on the bed. Presently she commenced to make a
strange noise,
and I saw her eyes were closed and her hands
clenched. "Ah," said
the landlady, who came in to help me; "she has
epileptic fits."
When her convulsions were over she looked blankly at
us, knitting
her brows and evidently puzzling her poor brain to
remember who
we were. For many years it was my fate to see her
looking at me
thus, at first stony and estranged, like a dweller
in another
star, then half-recalling with extended hand, then
forgetting
again with hand to mouth, then the gradual dawn of
memory and
love, and final full recognition. "It's Fred, my
Fred!" I never
got used to it; it always moved me to tears.... It
was not to be
thought that we had no quarrels. I still had fits of
bad temper,
and sometimes they came into collision with A.'s
temper. It hurt
my vanity considerably to see how soon she
relinquished the
respectful, patient, spaniel-bearing she had when we
were
traveling. I said some cruel things to her and she
retorted. One

would have thought, to hear us, that all affection was over. But when the mood of rage wore itself out we would both be sorry and make it up with tears, and be very happy in spite of our poverty.

I think it was lust that prevented me from striving to fulfill my ambitions. A. let me do anything I liked, at all times of day or night, although she seemed surprised at my proceedings sometimes, for it was becoming a fever of lubricity with me. She still thought only of her love. I remember her coming in one day, tired, pale, perspiring, and worried--we had hardly anything in the house and she had been to the theater ineffectually--and when her eyes lighted on me the whole expression of her face changed, softened and brightened at once, and she came and kissed me and said: "It is so strange, I was thinking all sorts of nasty things coming along, but as soon as I see my pet's face I feel happy--I don't care for anything--I would sooner share a crust with him than have all the money in the world!"

I commenced to feel libidinous curiosity to examine her--this was mostly on Sundays--and she let me, blushing at first, but laughing. Then I would try new positions in coitus I had heard of. Still she did not enter into my mood.

She was engaged at this time to play in a pantomime and I commenced to lead a miserable, jealous existence. I heard scandal

about her, baseless enough, but in the diseased,
nervous, anxious
state I had brought myself to it nearly drove me
mad. I would go
with her sometimes to visit her mother, whom I began
to like. Her
brother I still saluted coldly. It caused me horror
and jealousy
to see A. kissing him and letting him tickle her. In
my rage,
when we came home, I even said that perhaps she
would let him do
something else, naming it brutally and coarsely. I
remember her
shame, astonishment, indignation and tears. If ever
a man tried a
woman's love I did. But she forgave me, even that.

We went to live in a little cottage. It was in this
cottage that
A. first showed signs of lust, and in the diseased
state of my
mind, instead of regretting it, I encouraged her.
She told me one
day that the orgasm very often did not occur at the
same time
with her as with me, and that it would not unless I
put my little
finger into the anus. This her husband taught her,
and she would
rather have died than confess it to me when we first
met. We
would often devote our Sundays to having a picnic as
we termed
our lustful bouts, stimulating ourselves with wine.
Her temper
was not improved thereby (though her fits entirely
stopped for a
twelvemonth)--we had wordy warfares, but we made it
up again
always with tears. Nor did I allow myself to
deteriorate without
reactions and excursions into better things. I was
always reading
Emerson; it was he who rescued me from orthodox

Christianity and

taught me to trust in myself and in Nature. I have never ceased

this struggle towards better things to this day.

There, in a

nutshell, is my life; I have always been defeated when

temptation came, but I have never ceased to struggle. I

determined to be more abstemious in sexual indulgence and asked

her to help me. She agreed willingly, for she was easily led.

Whenever we fell back again into excess it was my fault.

At a theatrical performance we first met a Miss T., a young

German who sang. She was about 25, with modest, quiet and

engaging manners. A. and she became very friendly. I liked her;

she was tall, dark and lithe, but had bad teeth.

I had been ill and at this time A. and I had a quarrel, my temper

suddenly breaking out in murderous frenzy. I called her names and

finally put her outside the house, telling her to go to her

mother. I suffered a very hell of remorse and misery. Everything

in the quiet, lonely house reminded me of her, seemed fragrant of

her; my anguish became so keen I could not stop in the house,

though I was just as wretched walking about. I kept this up for

two days, when I met her coming to look for me. One look was

enough--"A.!" "Pet!" in broken sobs--and in tears we kissed and

made it up. Miss T. was with her, and I greeted her, too, with

happy tears in my eyes. Another time, when A. was

giving way to
her temper, and one would have thought all love
was dead, I
said "Don't you love me then?" and the word alone
was a talisman,
her face changed, she held out her arms and began to
sob
quietly.... She accepted an offer to travel with a
small
theatrical company who were going up-country. She
was not looking
well when I left and after a time I received a
telegram telling
me to come to her at once as she was ill. Dreading
all sorts of
things I borrowed my fare and went to her. I knew
nothing of
women, of their point of view and different code of
honor, and
was very far from the attitude of Guy de Maupassant
who said he
liked women all the better for their charmingly
deceitful ways.
A. wanted to see me and had taken the surest means
to ensure my
coming. I was angry at first, but she looked so well
and was so
loving that I could not be angry long.

One day when I was working the landlady came in and
began talking
about A. and her conduct before I came. She had gone
into the
actors' rooms at all hours, the woman said, and
drank and been as
bad as the rest in her conversation. It was the
second time a
married woman had run her down to me, and I
commenced to think
there might be something in it, and suffered all my
mad jealousy
over again. Not knowing the freedom actors and
actresses allow
themselves on tour, without there being necessarily
anything in

it, I worried till I thought I had nothing to do but die. And then one of the great struggles of my life occurred. Walking the country roads, I asked myself: "If it is true, if she has been unfaithful, will you forgive her and help her to arrive at her best?" For a long time the answer was "No!" But perhaps my striving for unity with myself had done some good, and the final resolution was for forgiveness. I felt more peace of mind then, and when I told a dying consumptive lodger in the house what the landlady had said, he replied, "Don't you believe a word of it. I know she loves you!"....

After an absence I found myself one evening in a town where A. was performing. I went round to the back and they told me she had gone to a room in the hotel to change for another part. I followed and entered the room, with a glass of spirits I found that an effeminate young actor was bringing to her. She was half undressed, her beautiful arms and shoulders bare. My arrival was unexpected and she looked at me surprised, I thought coldly, as I reproached her for not keeping a promise she had made to me to touch no alcohol during the tour, but soon her arms were round my neck. She cried like a child. She was bigger and handsomer and healthier. There was not only an increased strength and size, but an increased delicacy and sweetness; her eyes and brows were lovely; there was an indescribable bloom and

fragrance on her,
such as the sun leaves on a peach; the traveling,
country air,
and freedom from coitus (had I known it) had enabled
her to
arrive at her true self, not only a beautiful woman,
but a woman
of fascination, of wit, vivacity and universal
camaraderie. Her
face was like the dawn; all my fears and jealousy
left me like a
cloud that melts before the sun. I remember the look
on her face
as she embraced me in bed that night. It had just
the very
smallest touch of sensuality, but was more like some
beautiful
child's who is being caressed by one she loves; this
divine,
drowsy-eyed, adorable look I had never seen on her
face
before--nor have I since.

We fell back into our old lustful ways. Later on A.
became ill
and the black devil of epilepsy returned. I became
gloomy.... A
restlessness and selfish brutality came over me; our
love and
peace were gone. I persuaded A. to go to Melbourne
and look out
for an engagement. The day before she was to sail we
went to
Glenelg for a trip. The sea air, as often happened,
precipitated
A.'s fits. We had gone down to the pier and A. said
she felt bad.
I just managed to support her to the hotel before
she became
stiff, and I made some impatient remark (for she
nearly dragged
me down) which she heard, not being quite
unconscious and said
half incoherently and very pitiably: "Be kind, oh,
be kind!"

repeating it after consciousness left her. Her heart had been breaking all day at the prospect of parting, and also, I expect, because I was so ready to part with her. That moment was a crisis in my life. I was in a murderous humor, but she looked so unutterably wretched that it seemed impossible to be anything but kind. I made myself speak lovingly to her, in moments of partial consciousness, hired a room, carried her up, and nursed her and petted her all night. The act of self-control, and forcing myself to be kind whatever I felt, became a habit in time, a sort of second nature.

In a few days she sailed. When she had gone I was remorseful and mad with myself. How could I let her go by herself? I resolved to follow her as speedily as possible, and did so.

If I remember rightly I came to the conclusion about this time that we ought not to have coition unless we felt great love for each other. It seemed to corroborate this to a certain extent that A. always seemed more electric and pleasant to the touch when we had connection for love and not for lust. Leave it to Nature, I would say to myself. I began to feel how much my struggles, efforts and temperate living had improved me. I had more self-respect, though something of the old self-consciousness was still left. I did not get better continuously, but in an up-and-down zigzag. I still had moods of rage

approaching madness
and periods of neurotic depression. Long walks
decidedly helped
to cure me, and the sea, sun, wind, clouds and trees
colored my
dreams at night very sweetly. I frequently dreamed I
was walking
in orchards or forests, and a deeper, slightly
melancholy but
potent savor, as of a diviner destiny, was on my
soul.

After a long absence, during which she had
frequently been ill,
A. joined me. I could see she was recovering from
fits, which I
began to realize that she had more frequently in
absence from me,
and also from drinking, perhaps. She was small and
thin, but
fresh and sweet as honey, and all signs of fits and
tempers
passed away from her face, so wonderful in its
changes. I had
become so healthy through my abstinence, temperance
and long
walks that our meeting was a new revelation to me of
how
delicate, fragrant and divine a convalescent woman
may be. She
was glad and surprised to see me looking so well,
and if she put
her hand on my arm I felt a joyous thrill. I was
certainly a
better man for abstaining and she a better woman and
I determined
not to have connection unless we were carried away
by our love.
As a matter of fact we did not give way to excess,
though we were
very loving. I tried to persuade myself that we had
not gone back
to our old ways, but I could not do so long.

Miss T. put in an appearance every day. She did not

look so

innocent, but as it was no business of mine I did not trouble.

She seemed more attached to A. than ever.... A. was still very

loving with me, but it was an effort to me to keep up to her

pitch, and when A. proposed to go to Melbourne with Miss T, to

sell off the furniture before settling in Adelaide, I was rather

glad of the opportunity of abstaining from coitus and of watching

myself to see if I again improved. When A. and Miss T. came to

see me before going down to the steamer, A. was nearly crying and

Miss T., changed from the old welcome friend, was not only pale

and anxious, but looked guilty as if she had some treachery in

her mind; she could not meet my eye. I thought less of it then

than afterwards. And once more I took long walks at night and

rose early to catch the freshness of the mornings.

Some time before this I had read a book advocating a vegetarian

diet, and at this time I chanced to read Pater's beautiful "Denys

L'Auxerrois," the imaginary portrait of a young vine-dresser, who

was attractive beyond ordinary mortals and lived, until his fall

and deterioration, on fruit and water. The words, "a natural

simplicity in living" remained in my memory. I resolved to read

more carefully the book on scientific diet. Who can say, I

thought, what changes for the better may come to me if I live on

a strictly scientific and natural diet?

I fasted one whole day, and then had a breakfast of
cherries, in
the middle of the day a meal of fruit, and walking
in the
afternoon--a gray, rainy day--I felt so light, so
different, and
the gray sky looked so sweet and familiar, that I
was reminded of
the luminous visions of my boyhood. It was a
distinct revelation.
This Pan-like, almost Bacchic feeling, did not last,
however, nor
was I always able to maintain my new method of diet,
though I
tried to do so. I made the attempt, however, but I
imagine I was
more than usually run down. I would walk miles in
the hope of
feeling less restless. One holiday I walked down to
Glenelg,
having only had grapes for my dinner, and lying on
the beach I
looked through a strong binocular glass I had
borrowed at the
girls bathing. And the beauty of their faces in
their frames of
hair, of their arms, of their figures, seen through
their wet
clinging dresses, satisfied me and filled me with
joy, gave me
for a short time that peace and content--in harmony
with the
strong sunlight on the waves and the rhythmic surf
on the
shore--I was seeking. The summer evenings on the
pier or along
the beach had a peculiar savor; one felt the youth
and beauty
there even on dark nights, the air was fragrant with
them, white
dresses and summer hats disappearing down the beach
or over the
sand hills. It was easy--doubtless justifiable
sometimes--to put
a lewd construction on these disappearances; but I

felt it need
not have been so; that it was not necessary that
youth and
beauty, even the sexual act itself if led up to by
love, should
be a subject of giggling and sniggering. I always
left the beach
and its flitting summer dresses with a sigh.

A., after writing once, ceased writing at all and
once more her
mother and I were left in a state of anxiety and
suspense. At
last I determined to go to Melbourne to look for
her, the only
clue I had being a remark in her letter that a
certain actor was
giving her an engagement. In Melbourne I could not
find any
traces of her for some days and what traces I did
find of her
were not calculated to allay my anxious fears. One
hotel-keeper
told me that some one of A's name had stayed there
with another
hussy (giving Miss T's stage name): "There were nice
carryings on
with the pair of them." I thought of Miss T's
strange looks, but
could not imagine what hold she had on A., for A.
loved me, I
knew. I seemed to be in an inextricable maze. I
could settle to
nothing and was thinking of applying to the police
when I heard
that the actor A. had mentioned had taken his
company to the
Gippsland lakes. I followed to Sale, found the actor
and was told
that A. was not there. "She slipped me at the last
moment," he
said, "and remained in Melbourne." I returned to my
lodgings,
with my anxiety and nervous restlessness increased
tenfold. But

suddenly my fear and restlessness left me like a
cloud. I felt
quiet, young, peaceful, able to enjoy the country,
A. was
doubtless all right and would be able to explain her
silence. I
undressed leisurely and happily, thinking of the
stars.

The next day, Sunday, I awoke refreshed and still at
peace. After
breakfast, hearing children's voices, I went out
into the garden
and there was a collision of souls who somehow were
affinities. A
young girl about twelve or younger with a fine
presence and
handsome face fixed her eyes on me for half a minute
and then
came and sat on my knee. She was one of those
children I am
accustomed to call "love-children," because they are
so much
brighter, healthier, larger and more loving than
others. I always
imagine more love went to their making. We fell in
love and she
said, stroking my beard, "Oh, you are pretty!" and I
said, "And
so are you!" We were so affectionate that the
servant called the
child away and I went for a walk, finding my little
sweetheart
waiting for me on my return. The touch of her hand
was electric
and her voice fresh and musical. I kissed her, but
had become
more self-conscious since the morning and wondered
if her mother
or the servant were looking, or even if they would
appear. I was
not so frank and natural as my little chum. I have
often thought
of her since. She had the breadth of forehead, the
strength and

yet lightness of limb, together with the hands and feet, not too small, that I always imagine the dwellers in Paradise will have.

I returned to Melbourne and continued trying to find A. At the same time I commenced in earnest to live on fruit and brown bread only, and enjoyed better tone and health every day, so that it was a joy to walk down the street in the sun and exchange glances with passengers à la old Walt. One day in the Botanical Gardens veils seemed to be lifted off my eyes. I could look straight at the sun and taking my note of color from that golden light I turned my eyes on the flowers, the mown grass, the trees, and for the first time perceived what a heavenly color green is, what divine companions flowers are, and what a blue sky really means. For half an hour I was in Paradise, and to complete my joy Nature revealed to me a new and unexpected secret.

I was lying on a bench, basking, and my silk shirt coming open the strong sun made its way to my breast and presently I felt a totally new sensation there. I had discovered the last joy of the skin. My skin, fed by healthy fruit-made blood, must have functioned normally under the excitation of the sun just then (for a brief space only, alas!). I cannot describe the joy, any more than I could describe the taste of a peach to one who has only eaten apples: it was satisfying, divine. I opened my shirt

wider, but the feeling only spread faintly, and indeed this halcyon sunny hour terminated in a restlessness that sent me walking into town to look for A.

At last I heard, not of A., but of Miss T. She was in a ballet. I went round during rehearsal and while waiting entered into conversation with a little chorus girl with a good face, who was sewing. On my telling her whom I was seeking she stopped sewing and looked at me quickly: "Oh, are you her husband? I know her. _I have seen them together_." She looked as if she were going to tell me something, but merely shook her old-fashioned head in a mournful, indescribable way, saying "Why don't you keep your wife with you?" I went to the door and presently saw Miss T. She tried to avoid me, I thought, and looked more vicious than ever, but after a minute's thought reluctantly told me where she and A. were staying. To hide my fears and suspicions I had assumed a careless demeanor, but I think I should have strangled her had she refused to tell me. I hastily went to the place indicated and going up the stairs (to the astonishment of the people) opened the door and found myself face to face with A.--but how changed! She had the hard, harlot, loveless look I detested. I felt for a few minutes that I did not love her, and she regarded me coldly too, but presently old habits reinstated themselves. She put out her hands, very pitiably, and then was sobbing in my

arms. I

could get nothing out of her but sobs, and to this day do not know where she spent all these weeks nor why she did not write.

Miss T. came in after rehearsal, pale and hard-faced. I greeted her politely, but was watching her, trying to puzzle out why A.

did not look as she usually did after long absence from coition.

Miss T. took another room in the same house and was soon joined

by another ballet girl, young and very pretty, who soon began to

have fits. A. was always crying until Miss T. went away with her

pretty friend. I knew nothing, could hardly be said to suspect

anything definite, and yet I pitied that pretty girl whose eyes

looked so helpless and appealing.

I set to work again. But I continued to live on fruit and bread,

and taking off my clothes I would stand up at the window in the

sun. A lot of prostitutes, however, who lived at the back saw me

and were scandalized or shocked or thought me mad.

The landlady

heard of it and spoke to A. So I had to desist from my glorious

sun-baths.

We slept on a single bed, and though I did my best to avoid

coitus (I wanted to wait and think out some theory of it), A.,

who knew nothing of this, wanted to resume our old habits, and

finally I surrendered. But my sufferings next day were intense,

and I had the sense of having fallen from some high estate. My

thoughts were divided between two theories: one that
our misery
was caused by our diet, more or less; the other that
we had
fallen into some error as regards coitus, and this
was becoming
almost a certainty with me.

There is one incident I think worthy of note which
happened
before the "fall" just mentioned and when I was
living on fruit
and in splendid health. At a performance I saw a
girl on the
stage with handsome legs in tights, and once as she
straightened
her leg the knee-cap going into position gave me
such a strange
and keen joy--of that quality I call divine or
musical--that I
was like one suddenly awakened to the divinity and
beauty of the
female form. The joy was so keen and yet peaceful,
familiar, and
subjective that I could not help comparing it to a
happy chemical
change in the tissues of my own brain. Like the
unexpected
functioning of my skin in the sun it was a sign of a
partial
return to a normal condition, another glimpse of
Paradise.

I stuck to my new diet and gained a fresh elation
and joy in
life. Gradually clothes became insupportable, and I
went down to
the beach as often as possible to take them off, and
at nights,
beside the patient and astonished A., I would lie
naked. One
evening, passing some grass, I looked over the fence
like a gipsy
and felt a longing to take off my clothes and sleep
in the grass

all night. It was of course impossible. And A.
looked unhappily
in my face; she began to think her mother, who now
thought I was
mad, must be right.

That night I woke up and found myself having
coition. I was angry
and felt I had been put back in my progress, but a
fever of lust
now came over me. I would sit under the tap and let
the cold
water run over me to conquer the fever, but at the
end of a week
my hopes were frustrated and I even turned against
my natural
diet, on which I had made flesh. A., as I expected,
went through
her usual fits, and slowly recovered. (If we had
connection only
once she in about three weeks had a mild attack of
fits; if we
had coition more than once the fits were more
severe.) I relapsed
more than once and as a means of impressing my
resolution for
future abstinence I would walk for miles in the
middle of
pitch-black nights....

Miss T. came over to Adelaide and as I knew nothing
definite
against her and heard that she was engaged, I
thought perhaps my
suspicions were unfounded and was friendly. But one
day in town I
saw her and A. on a tram going out to our cottage.
Even then my
suspicions might not have been awakened, but I saw
Miss T. say
something rapidly to A., and A. called out to me,
"Will you be
coming home soon?" And I answered "No." When the
tram had gone on
I found myself vaguely wondering what Miss T. wanted

to know that
for, for my perceptions were becoming acute enough
to understand
women's ways. In another minute I was walking
rapidly home. When
I came to the door it was locked. I knocked and
knocked and no
one came. I called out and threatened to kick in the
door. Still
no one came. Mad with rage I commenced to put my
threat into
execution, when the door was opened by Miss T.,
half-naked, in
her petticoats, and pale as death, but no longer
defiant. "So
I've caught you, have I?" I looked, but could not
trust myself
to speak. Wondering why A. did not appear I went
into the
bedroom. She was lying on the bed, just as Miss T.
had left her,
on the verge of a fit, and on seeing me she held out
her hands
piteously, and when I stooped over her she
whispered, "Send her
away, send her away." Then she became unconscious
and going into
the next room I ordered Miss T. (who had managed to
scramble on
her dress) out of the house. I spoke scornfully as
if addressing
a dog, and she slinked out with a malignant but
cowed look I hope
never to see on a woman's face again. What they had
been doing
with their clothes off I do not know; women will
rather die than
confess. When A. had recovered from her fit she
denied that there
had been anything between them, and stuck to it
doggedly, but
with such a forlorn look I had not the heart to
prosecute my
inquiries.

For my part, all the efforts I had been making for so long seemed for a time to be in vain; for some weeks I sank into a sort of satyriasis, and even my anger against Miss T. turned to a prurient curiosity. At the same time I was not always able to adhere to my diet. But both as regards coition and diet I was still fighting, and on the whole successfully. My fits of temper, however, were excessive and my ennui became gloomy despair. One day I blasphemed on crossing the Park and spoke contemptuously of "God and his twopenny ha'penny revolving balls," referring to the planetary system. But for long walks I should have gone mad. A. was drinking in the intervals of her fits. I found half-empty bottles of wine hidden away. This did not improve my temper, and one day--this was when she was well and up--I struck her a heavy blow on the face, and she aimed a glass decanter at me. She went home to her mother and I lived alone in the cottage. I heard soon afterwards that her husband had come back and that they had made it up. Our parting was not, however, destined to be final.

Even out of that month's sufferings I made capital. I was better after my tendency to lubricity, my gloom, rage, restlessness and degradation. They had been but the irritations of convalescence.
